## KLEIN HYPERBOTTLE

## MILAN HEJNÝ

## 1. Introduction

Let G mean the open Grassmannian of all lines (not only those passing through the origin $O$ ) in the $(n+1)$-dimensional Euclidean space $\mathrm{R}^{n+1}$. Let $\mathrm{Kb}^{n}$ be a subspace of G which consists of all lines $x$ parallel to a given Euclidean plane $\mathrm{R}^{2} \subset R^{n+1}, n \geqq 2$ and tangent to the unit sphere $S^{n} \subset R^{n+1}$. Since $\mathrm{Kb}^{2}$ is homeomorphic to the Klein bottle (see [2]) there is good reason for a

Definition. The topological subspace $\mathrm{Kb}^{n}$ of G is called the Klein hyperbottle in $\mathrm{R}^{n+1}$.

The aim of this paper is:
(i) to find a CW-decomposition of $\mathrm{Kb}^{n}$ (see Theorem 1) and
(ii) to calculate the homology groups $\mathrm{H}_{i}\left(\mathrm{~Kb}^{n}\right)$ (see Theorem 2).

## 2. Notation

$S^{n}=\left\{x \in \mathrm{R}^{n+1}| | x \mid=1\right\}$ is the unit $n$-sphere;
$\mathrm{S}^{1}$ the unit circle is identified with $\left\{e^{i t} \mid t \in \mathrm{R}\right\} \subset \mathrm{C}$;
$\mathrm{B}^{n}=\left\{x \in \mathrm{R}^{n}| | x \mid \leqq 1\right\}$ is the closed $n$-dimensional unit ball with the boundary $\partial \mathrm{B}^{n}=\mathrm{S}^{n-1} ;$
$\langle a, b\rangle, a, b \in \mathrm{R}^{n+1}, b \neq 0$ means a line $\{a+\lambda b \mid \lambda \in \mathrm{R}\} \in \mathrm{G} ;$
$\alpha: \mathrm{C} \rightarrow \mathrm{R}^{n+1}, x+\mathrm{i} y \rightarrow(x, y, 0, \ldots, 0)$ and
$\beta: \mathrm{R}^{n-1} \rightarrow \mathrm{R}^{n+1},\left(x^{1}, \ldots, x^{n-1}\right) \rightarrow\left(0,0, x^{1}, \ldots, x^{n-1}\right)$ inclusion maps;
$\gamma:\left(\mathrm{B}^{n-2}, \partial \mathrm{~B}^{n-2}\right) \rightarrow\left(\mathrm{S}^{n-2},-k\right), w \rightarrow 2 \sqrt{1-|w|^{2}} w+\left(2|w|^{2}-1\right) k$,
where $k=(0, \ldots, 0,1) \in \mathbf{R}^{n-1}$;

* is the distinguished point of a factor-space $\mathrm{X} / \mathrm{Y}$

## 3. The CW-decomposition of $\mathrm{Kb}^{n}$

The Klein hyperbottle $\mathrm{Kb}^{n}$ will be expressed in a more suitable form, namely as a factor-space of $\mathrm{S}^{1} \times \mathrm{B}^{n-1}$. Then a CW -decomposition of $\mathrm{Kb}^{n}$ is described.

Lemma 1. Let $\Theta$ be an equivalence relation on $\mathrm{S}^{1} \times \mathrm{B}^{n-1}$ given as follows: $(u, v) \Theta\left(u^{\prime}, v^{\prime}\right) \Leftrightarrow\left(u=u^{\prime}\right.$ and $\left.v=v^{\prime}\right)$ or $\left(u+u^{\prime}=0\right.$ and $\left.v=v^{\prime} \in \partial \mathrm{B}^{n-1}\right)$.

Then the factor-space $\mathrm{K}=\left(\mathrm{S}^{1} \times \mathrm{B}^{n-1}\right) / \mathrm{E}$ is homeomorphic to the Klein hyperbottle $\mathbf{K b}{ }^{n}$.

Proof. It is not difficult to show that the map

$$
\sigma: \mathrm{S}^{1} \times \mathrm{B}^{n-1} \rightarrow \mathrm{~K}^{n},(u, v) \rightarrow\left\langle\sqrt{1-|v|^{2}} \alpha(u)+\beta(v), \alpha(\mathrm{i} u)\right\rangle
$$

is both, well-defined and surjective. Moreover, $\sigma(u, v)=\sigma\left(u^{\prime}, v^{\prime}\right)$ holds if and only if

$$
\sqrt{1}-|v|^{-2} \alpha(u)+\beta(v)=\sqrt{1-\left|v^{\prime}\right|^{2}} \alpha\left(u^{\prime}\right)+\beta\left(v^{\prime}\right) \text { and } \mathrm{i} u= \pm \mathrm{i} u^{\prime}
$$

i.e. $\quad v=v^{\prime}$ and $\left(u=u^{\prime}\right.$ or $\left.u=-u^{\prime}, v \in \partial \mathrm{~B}^{n-1}\right)$.

Hence $\mathrm{Kb}^{n}$, as a $\sigma$-image of $\mathrm{S}^{1} \times \mathrm{B}^{n-1}$ is homeomorphic to the factor-space $\mathrm{K}=\mathrm{S}^{1} \times \mathrm{B}^{n-1} / \Theta$.

Theorem 1. The Klein hyperbottle $\mathrm{Kb}^{n} \approx \mathrm{~K}=\mathrm{S}^{1} \times \mathrm{B}^{n-1} / \Theta$ admits a $C \mathrm{~W}^{-}$--decomposition into six disjoint cells of the dimension $0,1, n-2, n-1, n-1$ and n. Characteristic maps are

$$
\begin{aligned}
& \mathrm{e}^{0} \equiv f^{0}: \mathrm{B}^{0} \rightarrow \mathrm{~K}, 0 \rightarrow\left[ \pm 1, v_{0}\right], \text { where } v_{0}=(1,0, \ldots, 0) \in \mathrm{R}^{n} \\
& \mathrm{e}^{1} \equiv f^{1}: \mathrm{B}^{1} \rightarrow \mathrm{~K}, t \rightarrow\left[ \pm \mathrm{e}_{2 i(1)}, v_{0}\right], \\
& \mathrm{e}^{n-2} \equiv f^{n-2}: \mathrm{B}^{n-2} \rightarrow \mathbf{K}, w \rightarrow[ \pm 1, \gamma(w)], \\
& \mathrm{e}_{1}^{n-1} \equiv f_{1}^{n-1}: \mathrm{B}^{n-1} \rightarrow \mathrm{~K}, v \rightarrow[-1, v], \\
& \mathrm{e}_{2}^{n-1} \equiv f_{2}^{n-1}: \mathrm{B}^{1} \times \mathrm{B}^{n-2} \rightarrow \mathrm{~K},(t, w) \rightarrow\left[e^{\frac{\pi}{2} i(1 t)}, \gamma(w)\right], \\
& \mathrm{e}^{n} \equiv f^{n}: \mathrm{B}^{1} \times \mathbf{B}^{n-1} \rightarrow \mathrm{~K},(t, v) \rightarrow\left[\mathrm{e}^{-\tau i t}, v\right], \\
& \text { where } \mathrm{e}^{i} \equiv f^{i}: \mathrm{B}^{i} \rightarrow \mathbf{K} \text { means } \mathrm{e}^{i}=f^{i}\left(\operatorname{int} \mathrm{~B}^{i}\right) .
\end{aligned}
$$

Corollary. The Euler-Poincare characteristic of $\mathrm{Kb}^{n}$ is zero.
Proof. See [1] Proposition 5.9 p. 105.

## 4. Groups $\mathrm{H}_{i}\left(\mathrm{~Kb}^{n}\right)$

We compute the cellular boundary in the Klein hyparbottle $\mathrm{Kb}^{n}=\mathrm{K}$. First of all it is obvious that

$$
\begin{equation*}
\partial \mathrm{e}^{0}=0, \quad \partial \mathrm{e}^{1}=0, \quad \partial \mathrm{e}^{n-2}=0 \quad \text { and } \quad \partial \mathrm{e}_{1}^{n}= \pm \mathrm{e}^{n-2} \tag{1}
\end{equation*}
$$

Thus only the three incidence numbers, namely $\left[\mathrm{e}_{2}^{n}{ }^{1}: \mathrm{e}^{n-2}\right]$, $\left[\mathrm{e}^{n}: \mathrm{e}_{1}^{n-1}\right]$ and $\left[\mathrm{e}^{n}: \mathrm{e}_{2}^{n-1}\right]$ are in need of being computed.

Lemma 2. $\left[\mathrm{e}_{2}^{n-1}: \mathrm{e}^{n-2}\right]=0$, therefore $\partial \mathrm{e}_{\underline{2}}^{1}=0$.

Proof. The incidence number $\left[\mathrm{e}_{2}^{n-1}: \mathrm{e}^{n-2}\right]$ is defined as the degree of the map

$$
\Phi: \mathrm{S}^{n-2}=\partial\left(\mathrm{B}^{1} \times \mathrm{B}^{n-2}\right) \xrightarrow{\varphi} \mathrm{K}^{n-2} \xrightarrow{p} \mathrm{~K}^{n-2} /\left(\mathrm{K}^{n-2}-\mathrm{e}^{n-2}\right)=\mathrm{S}^{n-2}
$$

which is the composition of the attaching map $\varphi$ for $\mathrm{e}_{2}^{n}{ }^{1}$ and the canonical projection $p$ of the $(n-2)$-skeleton $\mathrm{K}^{n-2}$ of K . To check the number $\operatorname{deg} \Phi$ let us consider a map

$$
h: \mathrm{S}^{n-2}=\partial\left(\mathrm{B}^{1} \times \mathrm{B}^{n-2}\right) \rightarrow \mathrm{S}^{n-2}=\partial\left(\mathrm{B}^{1} \times \mathrm{B}^{n-2}\right),(t, w) \rightarrow(-t, w)
$$

regarded as the involution on $S^{n-2}$. Since $\operatorname{deg} h=-1$, and $\Phi=\Phi \circ h$, it is $\operatorname{deg} \Phi=\operatorname{deg} \Phi . \operatorname{deg} h=-\operatorname{deg} \Phi$, hence $\operatorname{deg} \Phi=0$.

Lemma 3. $\left[\mathrm{e}^{n}: \mathrm{e}_{1}^{n-1}\right]=0$ and $\left[\mathrm{e}^{n}: \mathrm{e}_{2}^{n}\right]= \pm 2$, therefore is $\partial \mathrm{e}^{n}= \pm 2 \mathrm{e}_{2}^{n-1}$. Proof. The first of these two assertions may be proved by the same argument as that of Lemma 2. The second assertion follows immediately from the characteristic maps $f^{n}$ and $f_{2}^{n-1}$.

Theorem 2. The homology groups of the Klein hyperbottle $\mathbf{K b b}^{n}$ are

$$
\begin{aligned}
& \quad n=2: \mathrm{H}_{0}\left(\mathrm{~Kb}^{2}\right)=\mathrm{Z}, \mathrm{H}_{1}\left(\mathrm{~Kb}^{2}\right)=\mathrm{Z}+\mathrm{Z}_{2}, \mathrm{H}_{i}\left(\mathrm{~Kb}^{2}\right)=0 \text { for }_{i} \neq 0,1 \\
& n>3:\left\{\begin{array}{l}
H_{0}\left(\mathrm{~Kb}^{n}\right)=\mathrm{Z} . \mathrm{H}_{1}\left(\mathrm{~Kb}^{n}\right)=\mathrm{Z}, \mathrm{H}_{n-1}\left(\mathrm{~Kb}^{n}\right)=\mathrm{Z}_{2}, \\
\mathrm{H}_{i}\left(\mathrm{~Kb}^{n}\right)=0, \text { for } i \neq 0,1, n-1 .
\end{array}\right.
\end{aligned}
$$
