# TWO-STAGE REGRESSION MODEL 

## LUBOMÍR KUBÁČEK

## Introduction

A mixed linear model is characterized by the relations $E(\boldsymbol{\eta} \boldsymbol{\beta})=\mathbf{X} \boldsymbol{\beta}$, $\operatorname{Var}(\boldsymbol{\eta} \boldsymbol{\vartheta})=\sum_{i=1}^{p} \vartheta_{i} \mathbf{V}_{i}$, where $\boldsymbol{Y}$ is an $n$-dimensional random vector, $\boldsymbol{\beta}$ is an unknown $k$-dimensional parameter, $\boldsymbol{\beta} \in \mathscr{R}^{k}(k$-dimensional Euclidean space), $\mathbf{X}$ is a known $n \times k$ matrix, $\boldsymbol{g}$ is a $p$-dimensional vector of variance components (usually unknown), $\boldsymbol{\vartheta}=\left(\vartheta_{1}, \ldots, \vartheta_{p}\right)^{\prime} \in \underline{\mathfrak{g}} \subset \mathscr{R}^{p}, \underline{\mathfrak{9}}$ is an open set, $\mathrm{V}_{i}, i=1, \ldots, p$, are known symmetric $n \times n$ matrices; $E$ and Var denote mean value and covariance matrix, respectively.

$$
\text { If } \boldsymbol{Y}=\left(\boldsymbol{Y}_{1}^{\prime}, \boldsymbol{Y}_{2}^{\prime}\right)^{\prime}, \mathbf{X}=\left[\begin{array}{cc}
\mathbf{X}_{1}, & \mathbf{0} \\
\mathbf{C}, & \mathbf{X}_{2}
\end{array}\right], \mathbf{C} \neq \mathbf{0}, \boldsymbol{\Sigma}=\left[\begin{array}{cc}
\boldsymbol{\Sigma}_{11}, & \mathbf{0} \\
\mathbf{0}, & \boldsymbol{\Sigma}_{22}
\end{array}\right],
$$

where the dimensions of the vectors $\boldsymbol{Y}_{1}$ and $\boldsymbol{Y}_{2}$ are $n_{1}$ and $n_{2}\left(n_{1}+n_{2}=n\right)$, the matrices $\mathbf{X}_{1}, \mathbf{X}_{2}$ are of the types $n_{1} \times k_{1}, n_{2} \times k_{2}$ and the matrices $\mathbf{\Sigma}_{11}, \Sigma_{22}$ are of the types $n_{1} \times n_{1}, n_{2} \times n_{2}$, respectively, then the regression model $(\boldsymbol{Y}, \mathbf{X} \boldsymbol{\beta}, \mathbf{\Sigma})$ is called the two-stage regression model ([1], [6], [7]).

The aim of the paper is to find the locally (or uniformly) best estimators of the parameters $\boldsymbol{\beta}$ and $\mathfrak{\vartheta}$ under some, in the following more excactly specified, conditions.

## 1. Notations, definitions and auxiliary statements

Definition 1.1. The two-stage regression model is regular if the ranks of the matrices $\mathbf{X}_{1}, \mathbf{X}_{2}, \boldsymbol{\Sigma}_{11}, \boldsymbol{\Sigma}_{22}$ are: $R\left(\mathbf{X}_{1}\right)=k_{1} \leqslant n_{1}, R\left(\mathbf{X}_{2}\right)=k_{2} \leqslant n_{2}, R\left(\mathbf{\Sigma}_{11}\right)=n_{1}$, $R\left(\Sigma_{22}\right)=n_{2}$.

In the following the matrices $\boldsymbol{\Sigma}_{11}$ and $\boldsymbol{\Sigma}_{22}$ are considered in the form $\Sigma_{11}=\sigma_{1}^{2} \mathrm{H}_{1}$ and $\Sigma_{22}=\sigma_{2}^{2} \mathrm{H}_{2}$, where $\sigma_{i}^{2} \in(0, \infty), i=1,2$, are variance components; thus $\boldsymbol{g}=\left(\sigma_{1}^{2}, \sigma_{2}^{2}\right)^{\prime} \in(0, \infty) \times(0, \infty)=\underline{\mathbf{g}}$. It is obvious that the matrix $\boldsymbol{\Sigma}(\boldsymbol{\vartheta})$ is regular for each $\boldsymbol{\vartheta} \in \underline{\boldsymbol{\xi}}$. The variance components are considered to be a)
known, b) unknown, their ratio $\varrho=\sigma_{1}^{2} / \sigma_{2}^{2}$ is known and c) unknown with the unknown ratio $\varrho$.

The LBLUE (locally best linear unbiased estimator) of the parameter $\boldsymbol{\beta}_{1}$, $i=1,2$, based on the vector $\boldsymbol{Y}_{i}$ is denoted by $\hat{\boldsymbol{\beta}}_{i}\left(\boldsymbol{Y}_{i}\right)$ (if it exists); thus, e.g., $\hat{\boldsymbol{\beta}}_{2}\left[\hat{\boldsymbol{\beta}}_{1}\left(\boldsymbol{Y}_{1}\right), \boldsymbol{Y}_{2}\right]$ is the LBLUE of $\boldsymbol{\beta}_{2}$ which is based on $\hat{\boldsymbol{\beta}}_{1}\left(\boldsymbol{Y}_{1}\right)$ and $\boldsymbol{Y}_{2}$. UBLUE means the uniform BLUE (with respect to the variance components).

The LMVQUIE (locally minimum variance quadratic unbiased invariant estimator) of the parameter $\sigma_{i}^{2}$ based on the vector $\boldsymbol{Y}_{i}$ is denoted as $\hat{\sigma}_{t}^{2}\left(\boldsymbol{Y}_{t}\right)$ (if it exists); estimators of the type $\boldsymbol{Y}^{\prime} \mathbf{A} \boldsymbol{Y}$ are considered only; thus $\hat{\sigma}_{2}^{2}\left[\hat{\sigma}_{1}^{2}\left(\boldsymbol{Y}_{1}\right), \hat{\boldsymbol{\beta}}\left(\boldsymbol{Y}_{1}\right)\right.$, $\left.\boldsymbol{Y}_{2}\right]$ is the LMVQUIE of $\sigma_{2}^{2}$ based on $\hat{\sigma}_{1}^{2}\left(\boldsymbol{Y}_{1}\right), \boldsymbol{\beta}_{1}\left(\boldsymbol{Y}_{1}\right)$ and $\boldsymbol{Y}_{2}$; here $\hat{\sigma}_{2}^{2}\left[\hat{\sigma}_{1}^{2}\left(\boldsymbol{Y}_{1}\right)\right.$, $\left.\hat{\boldsymbol{\beta}}_{1}\left(\boldsymbol{Y}_{1}\right), \quad \boldsymbol{Y}_{2}\right]=k_{1} \hat{\sigma}_{1}^{2}\left(\boldsymbol{Y}_{1}\right)+k_{2}\left[\hat{\boldsymbol{\beta}}_{1}^{\prime}\left(\boldsymbol{Y}_{1}\right), \quad \boldsymbol{Y}_{2}^{\prime}\right] \mathbf{A}\left[\hat{\boldsymbol{\beta}}_{1}^{\prime}\left(\boldsymbol{Y}_{1}\right), \boldsymbol{Y}_{2}^{\prime}\right]^{\prime} \quad\left(k_{1}, k_{2}\right.$ are properly chosen constants, $\mathbf{A}$ is a properly chosen matrix).

Within the two-stage regression model the estimators are permitted to be determined in the following sequence only:

$$
\begin{gathered}
\hat{\boldsymbol{\beta}}_{1}\left(\boldsymbol{Y}_{1}\right), \hat{\sigma}_{1}^{2}\left(\boldsymbol{Y}_{1}\right), \hat{\sigma}_{2}^{2}\left[\hat{\boldsymbol{\beta}}_{1}\left(\boldsymbol{Y}_{1}\right), \hat{\sigma}_{1}^{2}\left(\boldsymbol{Y}_{1}\right), \boldsymbol{Y}_{2}\right], \hat{\boldsymbol{\beta}}_{2}\left\{\hat{\boldsymbol{\beta}}_{1}\left(\boldsymbol{Y}_{1}\right), \boldsymbol{Y}_{2} \mid \hat{\sigma}_{1}^{2}\left(\boldsymbol{Y}_{1}\right),\right. \\
\left.\hat{\sigma}_{2}^{2}\left[\hat{\boldsymbol{\beta}}_{1}\left(\boldsymbol{Y}_{1}\right), \hat{\sigma}_{1}^{2}\left(\boldsymbol{Y}_{1}\right), \boldsymbol{Y}_{2}\right]\right\}, \hat{\sigma}_{2}^{2}\left(\boldsymbol{Y}_{1}, \boldsymbol{Y}_{2}\right), \hat{\sigma}_{1}^{2}\left(\boldsymbol{Y}_{1}, \boldsymbol{Y}_{2}\right), \hat{\boldsymbol{\beta}}_{2}\left[\boldsymbol{Y}_{1}, \boldsymbol{Y}_{2} \mid \hat{\sigma}_{1}^{2}\left(\boldsymbol{Y}_{1}, \boldsymbol{Y}_{2}\right),\right. \\
\left.\hat{\sigma}_{2}^{2}\left(\boldsymbol{Y}_{1}, \boldsymbol{Y}_{2}\right)\right], \hat{\boldsymbol{\beta}}_{1}\left[\boldsymbol{Y}_{1}, \boldsymbol{Y}_{2} \mid \hat{\sigma}_{1}^{2}\left(\boldsymbol{Y}_{1}, \boldsymbol{Y}_{2}\right), \sigma_{2}^{2}\left(\boldsymbol{Y}_{1}, \boldsymbol{Y}_{2}\right)\right] .
\end{gathered}
$$

The notation $\hat{\boldsymbol{\beta}}_{2}\left[\hat{\boldsymbol{\beta}}_{1}\left(\boldsymbol{Y}_{1}\right), \boldsymbol{Y}_{2} \mid \sigma_{1}^{2}, \sigma_{2}^{2}\right]$ means the $\left(\sigma_{1}^{2}, \sigma_{2}^{2}\right)$-LBLUE.
In what follows the normality of the vector $\boldsymbol{Y}$ is assumed; $\boldsymbol{Y} \sim N(\mathbf{X} \boldsymbol{\beta}, \mathbf{\Sigma})$.
The symbol $\mathbf{A}^{-}$means the generalized inverse ( $g$-inverse) of the matrix $\mathbf{A}$, i.e. $\mathbf{A A}^{-} \mathbf{A}=\mathbf{A} ; \mathbf{A}^{+}$is the Moore-Penrose $g$-inverse [4], $\mathbf{A}_{m}^{-} \mathbf{N}$ ) is the minimum $\mathbf{N}$-seminorm $g$-inverse of the matrix $\mathbf{A}[4]$. $\operatorname{Ker}(\mathbf{A})$ denotes the null-space of the matrix $\mathbf{A}$ and $\mathscr{M}(\mathbf{A})$ denotes the column space of the matrix $\boldsymbol{A}$.

Lemma 1.1. In the model $\boldsymbol{Y} \sim N_{n}\left(\mathbf{X} \boldsymbol{\beta}, \sum_{t=1}^{p} \vartheta_{l} \mathbf{V}_{t}\right)$ the unbiased invariant estimator of the vector $\boldsymbol{\vartheta}$ exists if and only if the matrix $\mathbf{K}^{(n)},\left\{\mathbf{K}^{(n}\right\}_{1},=\operatorname{Tr}(\mathbf{M V}, \mathbf{M V})$, $i, j=1, \ldots, p, \mathbf{M}=\mathbf{I}-\mathbf{X X} \mathbf{X}^{+}$, is regular. The matrix $\mathbf{K}^{(I)}$ is regular if and only if the matrices $\mathbf{M V} \mathbf{M}, \ldots, \mathbf{M V}_{p} \mathbf{M}$ are linearly independent.

Proof. See [5].
Lemma 1.2. If $\mathbf{K}^{(n)}$ from Lemma 1.1 is regular, then the $\boldsymbol{\vartheta}_{0}$-LMVQUIE of the vector $\boldsymbol{\vartheta}$ is $\hat{\boldsymbol{\vartheta}}(\boldsymbol{Y})=\mathbf{S}_{\left(\mathrm{M} \mathrm{\Sigma}_{0} \mathrm{M}\right)^{+}}^{-1} \hat{\gamma}$, where

$$
\begin{gathered}
\left\{\mathbf{S}_{\left(\mathbf{M} \mathbf{\Sigma}_{0} \mathbf{M}\right)^{+}}\right\}_{i, j}=\operatorname{Tr}\left[\left(\mathbf{M} \mathbf{\Sigma}_{0} \mathbf{M}\right)^{+} \mathbf{V}_{\mathbf{l}}\left(\mathbf{M} \mathbf{\Sigma}_{0} \mathbf{M}\right)^{+} \mathbf{V}_{i}\right], \quad i, j=1, \ldots, p, \\
\mathbf{M}=\mathbf{I}-\mathbf{X} \mathbf{X}^{+} . \boldsymbol{\Sigma}_{0}=\sum_{i=1}^{p} \vartheta_{01} \mathbf{V}_{i},\left(\vartheta_{01}, \ldots, \vartheta_{0 p}\right)^{\prime}=\boldsymbol{g}_{0}, \hat{\gamma}=\left(\hat{\gamma}_{1}, \ldots, \hat{\gamma}_{p}\right)^{\prime}, \\
\hat{\gamma}_{i}=\boldsymbol{Y}^{\prime}\left(\mathbf{M} \mathbf{\Sigma}_{0} \mathbf{M}\right)^{+} \mathbf{V}_{l}\left(\mathbf{M} \mathbf{\Sigma}_{0} \mathbf{M}\right)^{+} \boldsymbol{Y}, \quad i=1, \ldots, p .
\end{gathered}
$$

Proof. See [5].
Lemma 1.3. If $\boldsymbol{\Sigma}_{0}$ in Lemma 1.2 is regular, then $\left(\mathbf{M} \boldsymbol{\Sigma}_{0} \mathbf{M}\right)^{+}=\boldsymbol{\Sigma}_{0}^{-1}-\boldsymbol{\Sigma}_{0}{ }^{1} \mathbf{X}$. $\cdot\left(\mathbf{X}^{\prime} \boldsymbol{\Sigma}_{0}^{-1} \mathbf{X}\right)^{-} \mathbf{X}^{\prime} \boldsymbol{\Sigma}_{0}^{-1}$.

Proof. The statement follows from the definition of the Moore-Penrose $g$-inverse.

## 2. Solution

Theorem 2.1. If in the two-stage regression model the variance components $\sigma_{1}^{2}$ and $\sigma_{2}^{2}$ are known (i.e. the matrices $\boldsymbol{\Sigma}_{11}$ and $\boldsymbol{\Sigma}_{22}$ are known), then
(1) $\hat{\boldsymbol{\beta}}_{1}\left(\boldsymbol{Y}_{1}\right)=\left(\mathbf{X}_{1}^{\prime} \boldsymbol{\Sigma}_{11}^{-1} \mathbf{X}_{1}\right)^{-1} \mathbf{X}_{1}^{\prime} \boldsymbol{\Sigma}_{11}^{-1} \boldsymbol{Y}_{1}$,
(2) $\hat{\boldsymbol{\beta}}_{2}\left[\hat{\boldsymbol{\beta}}_{1}\left(\boldsymbol{Y}_{1}\right), \boldsymbol{Y}_{2}\right]=\left(\mathbf{X}_{2}^{\prime} \mathbf{K}_{2}^{-1} \mathbf{X}_{2}\right)^{-1} \mathbf{X}_{2}^{\prime} \mathbf{K}_{2}^{-1}\left[\boldsymbol{Y}_{2}-\mathbf{C} \hat{\boldsymbol{\beta}}_{1}\left(\boldsymbol{Y}_{1}\right)\right]$,

$$
\text { where } \mathbf{K}_{2}=\mathbf{C}\left(\mathbf{X}_{1}^{\prime} \boldsymbol{\Sigma}_{11}^{-1} \mathbf{X}_{1}\right)^{-1} \mathbf{C}^{\prime}+\boldsymbol{\Sigma}_{22} \text {, }
$$

(3) $\hat{\boldsymbol{\beta}}_{2}\left(\boldsymbol{Y}_{1}, \boldsymbol{Y}_{2}\right)=\hat{\boldsymbol{\beta}}_{2}\left[\hat{\boldsymbol{\beta}}_{1}\left(\boldsymbol{Y}_{1}\right), \boldsymbol{Y}_{2}\right]$,
(4) $\hat{\boldsymbol{\beta}}_{1}\left(\boldsymbol{Y}_{1}, \boldsymbol{Y}_{2}\right)=\hat{\boldsymbol{\beta}}_{1}\left(\boldsymbol{Y}_{1}\right)+\left(\mathbf{X}_{1}^{\prime} \boldsymbol{\Sigma}_{11}^{-1} \mathbf{X}_{1}\right)^{-1} \mathbf{C}^{\prime} \mathbf{K}_{2}^{-1} \boldsymbol{v}_{2}$, where

$$
\boldsymbol{v}_{2}=\boldsymbol{Y}_{2}-\mathbf{C} \hat{\boldsymbol{\beta}}_{1}\left(\boldsymbol{Y}_{1}\right)-\mathbf{X}_{2}\left(\mathbf{X}_{2}^{\prime} \mathbf{K}_{2}^{-1} \mathbf{X}_{2}\right)^{-1} \mathbf{X}_{2}^{\prime} \mathbf{K}_{2}^{-1}\left[\boldsymbol{Y}_{2}-\mathbf{C} \hat{\boldsymbol{\beta}}_{1}\left(\boldsymbol{Y}_{1}\right)\right] .
$$

Proof. (1) is a well-known fact (see, e.g., [2]); (2) is a consequence of the fact that $\boldsymbol{Y}_{2}-\mathbf{C} \hat{\boldsymbol{\beta}}_{1}\left(\boldsymbol{Y}_{1}\right) \sim N_{n_{2}}\left(\mathbf{X}_{2} \boldsymbol{\beta}_{2}, \mathbf{K}_{2}\right)$; (3) is proved in [1]. As regards (4) it is sufficient to prove that a) the vector $\left(\boldsymbol{V}_{1}^{\prime}, \boldsymbol{v}_{2}^{\prime}\right)^{\prime}, \boldsymbol{v}_{1}=\boldsymbol{Y}_{1}-\mathbf{X}_{1} \hat{\boldsymbol{\beta}}_{1}\left(\boldsymbol{Y}_{1}\right)$, represents the class of all linear unbiased estimators of the function $g\left(\boldsymbol{\beta}_{1}, \boldsymbol{\beta}_{2}\right)=0, \boldsymbol{\beta}_{1} \in \mathscr{R}^{k_{1}}$, $\boldsymbol{\beta}_{2} \in \mathscr{R}^{k_{2}}$, which are based on the vector $\left(\boldsymbol{Y}_{1}^{\prime}, \boldsymbol{Y}_{2}^{\prime}\right)^{\prime}$ and b) $\hat{\boldsymbol{\beta}}_{1}\left(\boldsymbol{Y}_{1}, \boldsymbol{Y}_{2}\right)$ arises from $\hat{\boldsymbol{\beta}}_{1}\left(\boldsymbol{Y}_{1}\right)$ using the covariance correction from the vector $\left(\boldsymbol{v}_{1}^{\prime}, \boldsymbol{v}_{2}^{\prime}\right)^{\prime}$. The rest of the proof is then a consequence of the C. R. Rao fundamental lemma of locally best unbiased estimators [3, p. 257].
a) The class of all linear unbiased estimators of the function $g$ is $\mathscr{U}_{0}=\left\{\boldsymbol{L}_{1}^{\prime} \boldsymbol{Y}_{1}+\boldsymbol{L}_{2}^{\prime} \boldsymbol{Y}_{2}: \boldsymbol{L}_{1} \in \mathscr{R}^{n_{1}}, \boldsymbol{L}_{2} \in \mathscr{R}^{n_{2}}, E\left(\boldsymbol{L}_{1}^{\prime} \boldsymbol{Y}_{1}+\boldsymbol{L}_{2}^{\prime} \boldsymbol{Y}_{2} \mid \boldsymbol{\beta}_{1}, \boldsymbol{\beta}_{2}\right)=0, \boldsymbol{\beta}_{1} \in \mathscr{R}^{k_{1}}, \boldsymbol{\beta}_{2} \in\right.$ $\left.\in \mathscr{R}^{k_{2}}\right\}=\left\{\boldsymbol{L}_{1}^{\prime} \boldsymbol{Y}_{1}+\boldsymbol{L}_{2}^{\prime} \boldsymbol{Y}_{2}:\left[\begin{array}{l}\boldsymbol{L}_{1} \\ \boldsymbol{L}_{2}\end{array}\right] \in \operatorname{Ker}\left[\begin{array}{cc}\mathbf{X}_{1}^{\prime}, & \mathbf{C}^{\prime} \\ \mathbf{0}, & \mathbf{X}_{2}^{\prime}\end{array}\right]\right\}$. We shall prove that

$$
\begin{align*}
\operatorname{Ker}\left[\begin{array}{cc}
\mathbf{X}_{1}^{\prime}, & \mathbf{C}^{\prime} \\
\mathbf{0}, & \mathbf{X}_{2}^{\prime}
\end{array}\right] & =\mathscr{M}\left[\begin{array}{ll}
\mathbf{A}_{11}, & \mathbf{A}_{12} \\
\mathbf{A}_{21}, & \mathbf{A}_{22}
\end{array}\right],  \tag{*}\\
\mathbf{A}_{11}=\mathbf{I}-\left(\mathbf{X}_{1}^{\prime}\right)_{m\left(\mathbf{I}_{11}\right)}^{-} \mathbf{X}_{1}^{\prime}, & \mathbf{A}_{12}=-\left(\mathbf{X}_{1}^{\prime}\right)_{m\left(\mathbf{I}_{11}\right)}^{-} \mathbf{C}^{\prime}\left[\mathbf{I}-\left(\mathbf{X}_{2}^{\prime}\right)_{m\left(\mathbf{K}_{2}\right)}^{-} \mathbf{X}_{2}^{\prime}\right], \\
\mathbf{A}_{21}=\mathbf{0}, & \mathbf{A}_{22}=\mathbf{I}-\left(\mathbf{X}_{2}^{\prime}\right)_{m\left(\mathbf{K}_{2}\right)}^{-} \mathbf{X}_{2}^{\prime} .
\end{align*}
$$

(*) follows from the inclusion

$$
\mathscr{M}\left[\begin{array}{ll}
\mathbf{A}_{11}, & \mathbf{A}_{12} \\
\mathbf{A}_{21}, & \mathbf{A}_{22}
\end{array}\right] \subset \operatorname{Ker}\left[\begin{array}{cc}
\mathbf{X}_{1}^{\prime}, & \mathbf{C}^{\prime} \\
\mathbf{0}, & \mathbf{X}_{2}^{\prime}
\end{array}\right]\left(\Leftarrow \mathscr{M}\left(\mathbf{C}^{\prime}\right) \subset \mathscr{M}\left(\mathbf{X}_{1}^{\prime}\right)=\mathscr{R}^{k_{1}}\right)
$$

and from the equality

$$
\operatorname{dim} \operatorname{Ker}\left[\begin{array}{cc}
\mathbf{X}_{1}^{\prime}, & \mathbf{C}^{\prime} \\
\mathbf{0}, & \mathbf{X}_{2}^{\prime}
\end{array}\right]=n_{1}+n_{2}-\left(k_{1}+k_{2}\right)=\operatorname{dim} \cdot \mu\left[\begin{array}{ll}
\mathbf{A}_{11}, & \mathbf{A}_{12} \\
\mathbf{A}_{21}, & \mathbf{A}_{22}
\end{array}\right] .
$$

Each vector $\left[\begin{array}{l}\boldsymbol{L}_{1} \\ \boldsymbol{L}_{2}\end{array}\right]$ from $\operatorname{Ker}\left[\begin{array}{cc}\mathbf{X}_{1}^{\prime}, & \mathbf{C}^{\prime} \\ \mathbf{0}, & \mathbf{X}_{2}^{\prime}\end{array}\right]$ can be expressed in the form

$$
\left(\boldsymbol{L}_{1}^{\prime}, \boldsymbol{L}_{2}^{\prime}\right)=\left(\boldsymbol{u}_{1}^{\prime}, \boldsymbol{u}_{2}^{\prime}\right)\left[\begin{array}{ll}
\mathbf{A}_{11}^{\prime}, & \mathbf{A}_{21}^{\prime} \\
\mathbf{A}_{12}^{\prime}, & \mathbf{A}_{22}^{\prime}
\end{array}\right], \boldsymbol{u}_{1} \in \mathscr{R}^{n_{1}}, \boldsymbol{u}_{2} \in \mathscr{R}^{n_{2}},
$$

i.e. the element from $\mathscr{U}_{0}$ is of the form $\left(\boldsymbol{u}_{1}^{\prime}, \boldsymbol{u}_{2}^{\prime}\right)\left[\begin{array}{l}\boldsymbol{v}_{1} \\ \boldsymbol{v}_{2}\end{array}\right]$, because of $\mathbf{A}_{11}^{\prime} \boldsymbol{Y}_{1}=$ $=\boldsymbol{v}_{1}\left(\mathrm{~A}_{21}=\mathbf{0}\right)$, and $\mathrm{A}_{12}^{\prime} \boldsymbol{Y}_{1}+\mathrm{A}_{22}^{\prime} \boldsymbol{Y}_{2}=\boldsymbol{v}_{2}$.
b) The estimator

$$
\hat{\boldsymbol{\beta}}_{1}\left(\boldsymbol{Y}_{1}\right)-\operatorname{cov}\left[\hat{\boldsymbol{\beta}}_{1}\left(\boldsymbol{Y}_{1}\right),\left[\begin{array}{l}
\boldsymbol{v}_{1}  \tag{**}\\
\boldsymbol{v}_{2}
\end{array}\right]\right]\left[\operatorname{Var}\left[\begin{array}{l}
\boldsymbol{v}_{1} \\
\boldsymbol{v}_{2}
\end{array}\right]\right]-\left[\begin{array}{l}
\boldsymbol{v}_{1} \\
\boldsymbol{v}_{2}
\end{array}\right]=\hat{\boldsymbol{\beta}}_{1}
$$

possesses the property

$$
\operatorname{cov}\left[\hat{\boldsymbol{\beta}}_{1},\left[\begin{array}{l}
\boldsymbol{v}_{1}  \tag{***}\\
\boldsymbol{v}_{2}
\end{array}\right]\right]=\mathbf{0}
$$

Here the equality

$$
\begin{gathered}
\operatorname{cov}\left[\hat{\boldsymbol{\beta}}_{1}\left(\boldsymbol{Y}_{1}\right),\left[\begin{array}{l}
\boldsymbol{v}_{1} \\
\boldsymbol{v}_{2}
\end{array}\right]\right]\left[\operatorname{Var}\left[\begin{array}{l}
\boldsymbol{v}_{1} \\
\boldsymbol{v}_{2}
\end{array}\right]\right]^{-} \operatorname{Var}\left[\begin{array}{l}
\boldsymbol{v}_{1} \\
\boldsymbol{v}_{2}
\end{array}\right]= \\
=\operatorname{cov}\left[\hat{\boldsymbol{\beta}}_{1}\left(\boldsymbol{Y}_{1}\right),\left[\begin{array}{l}
\boldsymbol{v}_{1} \\
\boldsymbol{v}_{2}
\end{array}\right]\right]\left(\Leftrightarrow \mathscr{M}\left(\left\{\operatorname{cov}\left[\hat{\boldsymbol{\beta}}_{1}\left(\boldsymbol{Y}_{1}\right),\left[\begin{array}{l}
\boldsymbol{v}_{1} \\
\boldsymbol{v}_{2}
\end{array}\right]\right]\right\}\right) \subset \mathscr{M}\left[\operatorname{Var}\left[\begin{array}{l}
\boldsymbol{v}_{1} \\
\boldsymbol{v}_{2}
\end{array}\right]\right]\right)
\end{gathered}
$$

was applied.
$(* * *)$ is the necessary and sufficient condition for (**) to be the LBLUE (see [3, p. 257]).

$$
\text { Because of } \operatorname{cov}\left[\hat{\boldsymbol{\beta}}_{1}\left(\boldsymbol{Y}_{1}\right),\left[\begin{array}{l}
\boldsymbol{v}_{1} \\
\boldsymbol{v}_{2}
\end{array}\right]\right]=\left[\mathbf{0},-\left(\mathbf{X}_{1}^{\prime} \boldsymbol{\Sigma}_{11}^{-1} \mathbf{X}_{1}\right)^{\prime} \mathbf{C}^{\prime} \mathbf{M}_{\mathbf{x}_{2}}^{\prime}\right]
$$

$$
\begin{gathered}
\operatorname{Var}\left[\begin{array}{l}
\boldsymbol{v}_{1} \\
\boldsymbol{v}_{2}
\end{array}\right]=\left[\begin{array}{cc}
\mathbf{M}_{\mathbf{x}_{1}}, & \mathbf{0} \\
\mathbf{0}, & \mathbf{M}_{\mathbf{x}_{2}}
\end{array}\right]\left[\begin{array}{cc}
\boldsymbol{\Sigma}_{11}, & \mathbf{0} \\
\mathbf{0}, & \mathbf{K}_{2}
\end{array}\right], \text { where } \mathbf{M}_{\mathbf{x}_{1}}=\mathbf{I}-\mathbf{P}_{\mathbf{x}_{1}}, \\
\mathbf{P}_{\mathbf{x}_{1}}=\mathbf{X}_{1}\left(\mathbf{X}_{1}^{\prime} \boldsymbol{\Sigma}_{11}^{-1} \mathbf{X}_{1}\right)^{-1} \mathbf{X}_{1}^{\prime} \boldsymbol{\Sigma}_{11}^{-1}, \mathbf{M}_{\mathbf{x}_{2}}=\mathbf{I}-\mathbf{P}_{\mathbf{x}_{2}}, \mathbf{P}_{\mathbf{x}_{2}}=\mathbf{X}_{2}\left(\mathbf{X}_{2}^{\prime} \mathbf{K}_{2}^{-1} \mathbf{X}_{2}\right)^{-1} \mathbf{X}_{2}^{\prime} \mathbf{K}_{2}^{-1}
\end{gathered}
$$

and because it can be easily shown that

$$
\left[\operatorname{Var}\left[\begin{array}{l}
\boldsymbol{v}_{1} \\
\boldsymbol{v}_{2}
\end{array}\right]\right]^{-}=\left[\begin{array}{cc}
\mathbf{\Sigma}_{11}^{-1}, & \mathbf{0} \\
\mathbf{0}, & \mathbf{K}_{2}^{-1}
\end{array}\right]\left[\begin{array}{cc}
\mathbf{M}_{\mathbf{x}_{1}}, & \mathbf{0} \\
\mathbf{0}, & \mathbf{M}_{\mathbf{x}_{2}}
\end{array}\right]
$$

we see that (**) after some rearrangement is $\hat{\boldsymbol{\beta}}_{1}\left(\boldsymbol{Y}_{1}, \boldsymbol{Y}_{2}\right)$ from (4).
Remark 2.1. Theorem 2.1 can be easily modified for the case of the known ratio $\varrho=\sigma_{1}^{2} / \sigma_{2}^{2}$ of the unknown covariance components.

Theorem 2.2. Consider a regular two-stage regression model with $\boldsymbol{\Sigma}_{11}=\sigma_{1}^{2} \mathbf{H}_{1}$ and $\boldsymbol{\Sigma}_{22}=\sigma_{2}^{2} \mathbf{H}_{2}$ when the ratio $\varrho=\sigma_{1}^{2} / \sigma_{2}^{2}$ of the unknown covariance components $\left(\sigma_{1}^{2}, \sigma_{2}^{2}\right) \in(0, \infty) \times(0, \infty)$ is unknown. Then

1. If $\mathscr{M}(\mathbf{C}) \not \subset \mathscr{M}\left(\mathbf{X}_{2}\right)$ and $n_{2}>k_{2}$, then there exist LMVQUIEs $\hat{\sigma}_{1}^{2}\left(Y_{1}, \boldsymbol{Y}_{2}\right)$ and $\hat{\sigma}_{2}^{2}\left(\boldsymbol{Y}_{1}, \boldsymbol{Y}_{2}\right)$.
2. If $\mathscr{M}(\mathbf{C}) \subset \mathscr{M}\left(\mathbf{X}_{2}\right), \quad n_{1}>k_{1}, \quad n_{2}>k_{2}$, then there exist UMVQUIEs $\hat{\sigma}_{1}^{2}\left(\boldsymbol{Y}_{1}, \boldsymbol{Y}_{2}\right)$ and $\hat{\sigma}_{2}^{2}\left(\boldsymbol{Y}_{1}, \boldsymbol{Y}_{2}\right)$.

Proof. Without any loss of generality we can consider

$$
\boldsymbol{\Sigma}_{11}=\hat{\sigma}_{1}^{2} \mathbf{I}, \boldsymbol{\Sigma}_{22}=\sigma_{2}^{2} \mathbf{I} \text {. If } \mathbf{V}_{1}=\left[\begin{array}{ll}
\mathbf{I}, & \mathbf{0} \\
\mathbf{0}, & \mathbf{0}
\end{array}\right], \mathbf{V}_{2} \equiv\left[\begin{array}{ll}
\mathbf{0}, & \mathbf{0} \\
\mathbf{0}, & \mathbf{I}
\end{array}\right] \text { and } \mathbf{X}=\left[\begin{array}{cc}
\mathbf{X}_{1}, & \mathbf{0} \\
\mathbf{C}, & \mathbf{X}_{2}
\end{array}\right]
$$

then

$$
\mathbf{P}=\mathbf{X}\left(\mathbf{X}^{\prime} \mathbf{X}\right)^{-1} \mathbf{X}^{\prime}=\left[\begin{array}{ll}
\mathbf{P}_{11}, & \mathbf{P}_{12} \\
\mathbf{P}_{21}, & \mathbf{P}_{22}
\end{array}\right]
$$

where

$$
\begin{gathered}
\mathbf{P}_{11}=\mathbf{X}_{1}\left(\mathbf{X}_{1}^{\prime} \mathbf{X}_{1}\right)^{-1} \mathbf{X}_{1}^{\prime}-\mathbf{X}_{1}\left(\mathbf{X}_{1}^{\prime} \mathbf{X}_{1}\right)^{-1} \mathbf{C}^{\prime} x \mathbf{C}\left(\mathbf{X}_{1}^{\prime} \mathbf{X}_{1}\right)^{-1} \mathbf{X}_{1}^{\prime}, \\
\boldsymbol{x}=\mathbf{K}^{-1}-\mathbf{K}^{-1} \mathbf{X}_{2}\left(\mathbf{X}_{2}^{\prime} \mathbf{K}^{-1} \mathbf{X}_{2}\right)^{-1} \mathbf{X}_{2}^{\prime} \mathbf{K}^{-1}
\end{gathered}
$$

( $=\mathbf{K}^{-1} \mathbf{M}_{\mathbf{x}_{2}}, \mathbf{M}_{\mathbf{x}_{2}}$ is the $\mathbf{K}^{-1}$ - projector onto the $\mathbf{K}^{-1}$-orthogonal complement of the subspace $\left.\mathscr{M}\left(\mathbf{X}_{2}\right)\right)$,

$$
\begin{aligned}
& \mathbf{K}=\mathbf{C}\left(\mathbf{X}_{1}^{\prime} \mathbf{X}_{1}\right)^{-1} \mathbf{C}^{\prime}+\mathbf{I}, \\
& \mathbf{P}_{12}=\mathbf{X}_{1}\left(\mathbf{X}_{1}^{\prime} \mathbf{X}_{1}\right)^{-1} \mathbf{C}^{\prime} \boldsymbol{x}=\mathbf{P}_{21}^{\prime}, \\
& \mathbf{P}_{22}=\mathbf{I}-\boldsymbol{x}
\end{aligned}
$$

Here the relationships

$$
\left[\begin{array}{cc}
\mathbf{X}_{1}^{\prime} \mathbf{X}_{1}+\mathbf{C}^{\prime} \mathbf{C}, & \mathbf{C}^{\prime} \mathbf{X}_{2} \\
\mathbf{X}_{2}^{\prime} \mathbf{C}, & \mathbf{X}_{2}^{\prime} \mathbf{X}_{2}
\end{array}\right]^{-1}=\left[\begin{array}{ll}
\mathbf{A}, & \mathbf{B} \\
\mathbf{B}^{\prime}, & \mathbf{D}
\end{array}\right]^{-1}=
$$

$$
\begin{gathered}
=\left[\begin{array}{cc}
\mathbf{A}^{-1}+\mathbf{A}^{-1} \mathbf{B}\left(\mathbf{D}-\mathbf{B}^{\prime} \mathbf{A}^{-1} \mathbf{B}\right)^{-1} \mathbf{B}^{\prime} \mathbf{A}^{-1}, & -\mathbf{A}^{-1} \mathbf{B}\left(\mathbf{D}-\mathbf{B}^{\prime} \mathbf{A}^{-1} \mathbf{B}\right)^{-1} \\
-\left(\mathbf{D}-\mathbf{B}^{\prime} \mathbf{A}^{-1} \mathbf{B}\right)^{-1} \mathbf{B}^{\prime} \mathbf{A}^{-1}, & \left(\mathbf{D}-\mathbf{B}^{\prime} \mathbf{A}^{-1} \mathbf{B}\right)^{-1}
\end{array}\right], \\
\left(\mathbf{X}_{1}^{\prime} \mathbf{X}_{1}+\mathbf{C}^{\prime} \mathbf{C}\right)^{-1}=\left(\mathbf{X}_{1}^{\prime} \mathbf{X}_{1}\right)^{-1}-\left(\mathbf{X}_{1}^{\prime} \mathbf{X}_{1}\right)^{-1} \mathbf{C}^{\prime}\left[\mathbf{I}+\mathbf{C}\left(\mathbf{X}_{1}^{\prime} \mathbf{X}_{1}\right)^{-1} \mathbf{C}^{\prime}\right]^{-1} \mathbf{C}\left(\mathbf{X}_{1}^{\prime} \mathbf{X}_{1}\right)^{-1}= \\
=\left(\mathbf{X}_{1}^{\prime} \mathbf{X}_{1}\right)^{-1}-\left(\mathbf{X}_{1}^{\prime} \mathbf{X}_{1}\right)^{-1} \mathbf{C}^{\prime} \mathbf{K}^{-1} \mathbf{C}\left(\mathbf{X}_{1}^{\prime} \mathbf{X}_{1}\right)^{-1}
\end{gathered}
$$

and $\mathbf{C}\left(\mathbf{X}_{1}^{\prime} \mathbf{X}_{1}\right)^{-1} \mathbf{C}^{\prime}=\mathbf{K}-\mathbf{I}$ were utilized. In accordance with Lemma 1.1 it can be easily shown that

$$
\begin{aligned}
& \mathbf{M} \mathbf{V}_{1} \mathbf{M}=\left[\begin{array}{cc}
\left(\mathbf{I}-\mathbf{P}_{11}\right)^{2}, & -\left(\mathbf{I}-\mathbf{P}_{11}\right) \mathbf{P}_{12} \\
-\mathbf{P}_{21}\left(\mathbf{I}-\mathbf{P}_{11}\right), & \mathbf{P}_{21} \mathbf{P}_{12}
\end{array}\right], \\
& \mathbf{M} \mathbf{V}_{2} \mathbf{M}=\left[\begin{array}{cc}
\mathbf{P}_{12} \mathbf{P}_{21}, & -\mathbf{P}_{12}\left(\mathbf{I}-\mathbf{P}_{22}\right) \\
-\left(\mathbf{I}-\mathbf{P}_{22}\right) \mathbf{P}_{21}, & \left(\mathbf{I}-\mathbf{P}_{22}\right)^{2}
\end{array}\right],
\end{aligned}
$$

where $\mathbf{M}=\mathbf{I}-\mathbf{P}$. The diagonal submatrices of the matrices $\mathbf{M} \mathbf{V}_{1} \mathbf{M}$ and $\mathbf{M} \mathbf{V}_{2} \mathbf{M}$ can be expressed as follows:

$$
\begin{gathered}
\left(\mathbf{I}-\mathbf{P}_{11}\right)^{2}=\mathbf{M}_{\mathbf{x}_{1}}^{*}+\mathbf{X}_{1}\left(\mathbf{X}_{1}^{\prime} \mathbf{X}_{1}\right)^{-1} \mathbf{C}^{\prime}\left(\boldsymbol{x}-\boldsymbol{x}^{2}\right) \mathbf{C}\left(\mathbf{X}_{1}^{\prime} \mathbf{X}_{1}\right)^{-1} \mathbf{X}_{1}^{\prime} \\
\mathbf{M}_{\mathbf{x}_{1}}^{*}=\mathbf{I}-\mathbf{X}_{1}\left(\mathbf{X}_{1}^{\prime} \mathbf{X}_{1}\right)^{-1} \mathbf{X}_{1}^{\prime}, \\
\mathbf{P}_{21} \mathbf{P}_{12}=x-\boldsymbol{x}^{2} \\
\mathbf{P}_{12} \mathbf{P}_{21}=\mathbf{X}_{1}\left(\mathbf{X}_{1}^{\prime} \mathbf{X}_{1}\right)^{-1} \mathbf{C}^{\prime} \boldsymbol{x}^{2} \mathbf{C}\left(\mathbf{X}_{1}^{\prime} \mathbf{X}_{1}\right)^{-1} \mathbf{X}_{1}^{\prime} \\
\left(\mathbf{I}-\mathbf{P}_{22}\right)^{2}=\boldsymbol{x}^{2}
\end{gathered}
$$

Furthermore, $\boldsymbol{x} \neq \mathbf{0}\left(\Leftarrow n_{2}>k_{2}\right)$ and $\boldsymbol{x}^{2} \neq \boldsymbol{x}\left(\Leftarrow \mathscr{M}(\mathbf{C}) \not \subset \mathscr{M}\left(\mathbf{X}_{2}\right)\right)$. The first implication is obvious. The other can be proved by contradiction. Let $x=x^{2}$. Then

$$
\mathbf{K}^{-1} \mathbf{M}_{\mathbf{x}_{2}}=\mathbf{K}^{-1} \mathbf{M}_{\mathbf{x}_{2}} \mathbf{K}^{-1} \mathbf{M}_{\mathbf{x}_{2}}\left(\Leftrightarrow \mathbf{M}_{\mathbf{x}_{2}} \mathbf{K}^{-i} \mathbf{M}_{\mathbf{x}_{2}}=\mathbf{M}_{\mathbf{x}_{2}}\right)
$$

and

$$
\begin{aligned}
& \mathbf{K}^{-1}=\left[\mathbf{I}+\mathbf{C}\left(\mathbf{X}_{1}^{\prime} \mathbf{X}_{1}\right)^{-1} \mathbf{C}^{\prime}\right]^{-1}=\mathbf{I}-\mathbf{C}\left(\mathbf{X}_{1}^{\prime} \mathbf{X}_{\mathbf{1}}+\mathbf{C}^{\prime} \mathbf{C}\right)^{-1} \mathbf{C}^{\prime} \Rightarrow \mathbf{M}_{\mathbf{x}_{2}} \mathbf{K}^{-1} \mathbf{M}_{\mathbf{x}_{2}}= \\
&=\mathbf{M}_{\mathbf{x}_{2}}-\mathbf{M}_{\mathbf{x}_{2}} \mathbf{C}\left(\mathbf{X}_{1}^{\prime} \mathbf{X}_{1}+\mathbf{C}^{\prime} \mathbf{C}\right)^{-1} \mathbf{C}^{\prime} \mathbf{M}_{\mathbf{x}_{2}} \text { thus } \mathbf{M}_{\mathbf{x}_{2}} \mathbf{K}^{-1} \mathbf{M}_{\mathbf{x}_{2}}=\mathbf{M}_{\mathbf{x}_{2}} \Rightarrow \\
& \Rightarrow \mathbf{M}_{\mathbf{x}_{2}} \mathbf{C}\left(\mathbf{X}_{1}^{\prime} \mathbf{X}_{1}+\mathbf{C}^{\prime} \mathbf{C}\right)^{-1} \mathbf{C}^{\prime} \mathbf{M}_{\mathbf{x}_{2}}=\mathbf{0} \Rightarrow \mathbf{M}_{\mathbf{x}_{2}} \mathbf{C}=\mathbf{0} \Rightarrow \mathscr{M}(\mathbf{C}) \subset \mathscr{M}\left(\mathbf{X}_{2}\right) .
\end{aligned}
$$

As $x$ is positive semidefinite $\boldsymbol{x} \neq 0 \Rightarrow x^{2} \neq 0$. If $\forall\left\{k \in \mathscr{R}^{\prime}\right\} x-x^{2} \neq k x^{2}$, then $\mathbf{P}_{21} \mathbf{P}_{12}$ and $\left(\mathbf{I}-\mathbf{P}_{22}\right)^{2}$ are linearly independent and thus $\mathbf{M V} \mathbf{M}$ and $\mathbf{M} \mathbf{V}_{2} \mathbf{M}$ are linearly independent. If $\exists\left\{k_{0} \in \mathscr{R}^{\prime}\right\} \boldsymbol{x}-\boldsymbol{x}^{2}=k_{0} \boldsymbol{x}^{2}$, then

$$
\left(\mathbf{I}-\mathbf{P}_{11}\right)^{2}=\mathbf{M}_{\mathbf{X}_{1}}^{*}+k_{0} \mathbf{X}_{1}\left(\mathbf{X}_{1}^{\prime} \mathbf{X}_{1}\right)^{-1} \mathbf{C}^{\prime} \boldsymbol{x}^{2} \mathbf{C}\left(\mathbf{X}_{1}^{\prime} \mathbf{X}_{1}\right)^{-1} \mathbf{X}_{1}^{\prime}
$$

and

$$
\mathbf{P}_{12} \mathbf{P}_{21}=\mathbf{X}_{1}\left(\mathbf{X}_{1}^{\prime} \mathbf{X}_{1}\right)^{-1} \mathbf{C}^{\prime} x^{2} \mathbf{C}\left(\mathbf{X}_{1}^{\prime} \mathbf{X}_{1}\right)^{-1} \mathbf{X}_{1}^{\prime}
$$

are nonzero matrices $\left(\left(\mathbf{I}-\mathbf{P}_{11}\right)^{2} \neq \mathbf{0}\right.$ is obvious; $\mathbf{P}_{12} \mathbf{P}_{21} \neq \mathbf{0} \Leftarrow$ the rank

$$
\begin{aligned}
R\left(\mathbf{P}_{21}\right)= & R\left[\dot{\chi} \mathbf{C}\left(\mathbf{X}_{1}^{\prime} \mathbf{X}_{1}\right)^{-1} \mathbf{X}_{1}^{\prime}\right]=R\left[\mathbf{K}^{-1} \mathbf{M}_{\mathbf{x}_{2}} \mathbf{C}\left(\mathbf{X}_{1}^{\prime} \mathbf{X}_{1}\right)^{-1} \mathbf{X}_{1}^{\prime}\right] \geqslant \\
& \geqslant R\left[\mathbf{M}_{\mathbf{x}_{2}} \mathbf{C}\left(\mathbf{X}_{1}^{\prime} \mathbf{X}_{1}^{-1} \mathbf{X}_{1}^{\prime} \mathbf{X}_{1}\right]=R\left(\mathbf{M}_{\mathbf{x}_{2}} \mathbf{C}\right)>0\right.
\end{aligned}
$$

because of the assumption $\left.\mathscr{M}(\mathbf{C}) \not \subset \mathscr{M}\left(\mathbf{X}_{2}\right)\right)$ and they are linearly independent. It is a consequence of the fact that the column space of the matrix $\mathbf{M}_{\mathbf{X}_{1}}$ is orthogonal to the column space of the matrix $\mathbf{X}_{1}\left(\mathbf{X}_{1}^{\prime} \mathbf{X}_{1}\right)^{-1} \mathbf{C}^{\prime} \boldsymbol{x}^{2} \mathbf{C}\left(\mathbf{X}_{1}^{\prime} \mathbf{X}_{1}\right)^{-1} \mathbf{X}_{1}^{\prime}$, thus they are linearly independent. This implies the linear independence of the matrices $\mathbf{M V} \mathbf{M}$ and $\mathbf{M V} \mathbf{M}$. With respect to Lemma 1.1 the matrix $\mathbf{K}^{(I)}$ is regular.

The proof of the assertion 2 see in [6].
Theorem 2.3. In the regular two-stage regression model from Theorem 2.2 it is valid that

1. If $n_{1}>k_{1}$, then the UMVQUIE (with respect to $\sigma_{1}^{2}$ ) of the variance component $\sigma_{1}^{2}$ based on the vector $Y_{1}$ is

$$
\hat{\sigma}_{1}^{2}\left(\boldsymbol{Y}_{1}\right)=\boldsymbol{v}_{1}^{\prime} \mathbf{H}_{1}^{-1} \boldsymbol{v}_{1} /\left(n_{1}-k_{1}\right), \boldsymbol{v}_{1}=\boldsymbol{Y}_{1}-\mathbf{X}_{1} \hat{\boldsymbol{\beta}}_{1}\left(\boldsymbol{Y}_{1}\right)
$$

2. If $\mathscr{M}(\mathbf{C}) \not \subset \mathscr{M}\left(\mathbf{X}_{2}\right) \& n_{2}>k_{2}$, then

$$
\begin{gathered}
\hat{\sigma}_{1}^{2}\left(\boldsymbol{Y}_{1}, \boldsymbol{Y}_{2} \mid \sigma_{01}^{2}, \sigma_{02}^{2}\right)=\frac{1}{\Delta}\left\{[ ( n _ { 1 } - k _ { 1 } ) \hat { \sigma } _ { 1 } ^ { 2 } ( \boldsymbol { Y } _ { 1 } ) + \sigma _ { 0 1 } ^ { 2 } \boldsymbol { v } _ { 2 } ^ { \prime } \mathbf { K } _ { 2 } ^ { - 1 } \boldsymbol { v } _ { 2 } ] \left[n_{2}-k_{2}-2 \operatorname{Tr}(\mathbf{R})+\right.\right. \\
\left.\left.+\operatorname{Tr}\left(\mathbf{R}^{2}\right)\right]-\sigma_{01}^{2} \sigma_{02}^{2} \boldsymbol{V}_{2}^{\prime} \mathbf{K}_{2}^{-1} \mathbf{H}_{2} \mathbf{K}_{2}^{-1} \boldsymbol{v}_{2}\left[n_{2}-k_{2}-\operatorname{Tr}(\mathbf{R})\right]\right\}
\end{gathered}
$$

is the $\left(\sigma_{01}^{2}, \sigma_{02}^{2}\right)$-LMVQUIE of the variance component $\sigma_{1}^{2}$ and

$$
\begin{aligned}
& \hat{\sigma}_{2}^{2}\left(\boldsymbol{Y}_{1}, \boldsymbol{Y}_{2} \mid \sigma_{01}^{2}, \sigma_{02}^{2}\right)=\frac{1}{\Delta}\left\{\boldsymbol{v}_{2}^{\prime} \mathbf{K}_{2}^{-1} \mathbf{H}_{2} \mathbf{K}_{2}^{-1} \boldsymbol{v}_{2} \sigma_{02}^{2}\left[n_{1}-k_{1}+\operatorname{Tr}(\mathbf{R})\right]-\right. \\
& \left.\quad-\sigma_{02}^{2}\left[\sigma_{01}^{-2}\left(n_{1}-k_{1}\right) \hat{\sigma}_{1}^{2}\left(\boldsymbol{Y}_{1}\right)+\boldsymbol{v}_{2}^{\prime} \mathbf{K}_{2}^{-1} \boldsymbol{v}_{2}\right]\left[\operatorname{Tr}(\mathbf{R})-\operatorname{Tr}\left(\mathbf{R}^{2}\right)\right]\right\}
\end{aligned}
$$

is the $\left(\sigma_{01}^{2}, \sigma_{02}^{2}\right)$-LMVQUIE of the variance component $\sigma_{2}^{2}$. Here

$$
\begin{gathered}
\Delta=\operatorname{det}\left[\begin{array}{cc}
n_{1}-k_{1}+\operatorname{Tr}\left(\mathbf{R}^{2}\right), & \operatorname{Tr}(\mathbf{R})-\operatorname{Tr}\left(\mathbf{R}^{2}\right) \\
\operatorname{Tr}(\mathbf{R})-\operatorname{Tr}\left(\mathbf{R}^{2}\right), & n_{2}-k_{2}-2 \operatorname{Tr}(\mathbf{R})+\operatorname{Tr}\left(\mathbf{R}^{2}\right)
\end{array}\right] \\
\mathbf{K _ { 2 }}=\sigma_{01}^{2} \mathbf{C}\left(\mathbf{X}_{1}^{\prime} \mathbf{H}_{1}^{-1} \mathbf{X}_{1}\right)^{-1} \mathbf{C}^{\prime}+\sigma_{02}^{2} \mathbf{H}_{2}, \\
\mathbf{R}
\end{gathered}=\mathbf{C}\left(\mathbf{X}_{1}^{\prime} \mathbf{H}_{1}^{-1} \mathbf{X}_{1}\right)^{-1} \mathbf{C}^{\prime} \sigma_{01}^{2}\left[\mathbf{K}_{2}^{-1}-\mathbf{K}_{2}^{-1} \mathbf{X}_{2}\left(\mathbf{X}_{2}^{\prime} \mathbf{K}_{2}^{-1} \mathbf{X}_{2}\right)^{-1} \mathbf{X}_{2}^{\prime} \mathbf{K}_{2}^{-1}\right] . . ~ \$
$$

3. If $\mathscr{M}(\mathbf{C}) \subset \mathscr{M}\left(\mathbf{X}_{2}\right) \& n_{1}>k_{1} \& n_{2}>k_{2}$, then the UMVQUIE of $\sigma_{1}^{2}$ and $\sigma_{2}^{2}$ are

$$
\begin{gathered}
\hat{\sigma}_{1}^{2}\left(\boldsymbol{Y}_{1}, \boldsymbol{Y}_{2}\right)=\hat{\sigma}_{1}^{2}\left(\boldsymbol{Y}_{1}\right)=\left\{\mathbf{1} / \mathrm{Tr}\left[\left(\mathbf{M}_{1} \mathbf{H}_{1} \mathbf{M}_{1}\right)^{+} \mathbf{H}_{1}\left(\mathbf{M}_{1} \mathbf{H}_{1} \mathbf{M}_{1}\right)^{+}\right]\right\} \boldsymbol{Y}_{1}^{\prime}\left(\mathbf{M}_{1} \mathbf{H}_{1} \mathbf{M}_{1}\right)^{+} \mathbf{H}_{1} \cdot \\
\cdot\left(\mathbf{M}_{1} \mathbf{H}_{1} \mathbf{M}_{1}\right)^{+} \boldsymbol{Y}_{1} \\
\hat{\sigma}_{2}^{2}\left(\boldsymbol{Y}_{1}, \boldsymbol{Y}_{2}\right)=\hat{\sigma}_{2}^{2}\left(\boldsymbol{Y}_{2}\right)=\left\{1 / \operatorname{Tr}\left[\left(\mathbf{M}_{2} \mathbf{H}_{2} \mathbf{M}_{2}\right)^{+} \mathbf{H}_{2}\left(\mathbf{M}_{2} \mathbf{H}_{2} \mathbf{M}_{2}\right)^{+}\right]\right\} \boldsymbol{Y}_{2}^{\prime}\left(\mathbf{M}_{2} \mathbf{H}_{2} \mathbf{M}_{2}\right)^{+} \mathbf{H}_{2} . \\
\cdot\left(\mathbf{M}_{2} \mathbf{H}_{2} \mathbf{M}_{2}\right)^{+} \boldsymbol{Y}_{2}
\end{gathered}
$$

where $\mathbf{M}_{i}=\mathbf{I}-\mathbf{X}_{i} \mathbf{X}_{i}^{+}, i=1,2$.
Proof. 1. The statement is a well-known fact (see, e.g., [2, Section 5.4]).
2. Let us denote $\mathbf{X}=\left[\begin{array}{cc}\mathbf{X}_{1}, & \mathbf{0} \\ \mathbf{C}, & \mathbf{X}_{2}\end{array}\right], \boldsymbol{\Sigma}_{0}=\left[\begin{array}{cc}\sigma_{01}^{2} \mathbf{H}_{1}, & \mathbf{0} \\ \mathbf{0}, & \sigma_{02}^{2} \mathbf{H}_{2}\end{array}\right]=\sigma_{01}^{2} \mathbf{V}_{1}+\sigma_{02}^{2} \mathbf{V}_{2}$, $\mathbf{M}=\mathbf{I}-\mathbf{X X}^{+}$. Then by Lemma 1.3

$$
\left(\mathbf{M} \boldsymbol{\Sigma}_{0} \mathbf{M}\right)^{+}=\boldsymbol{\Sigma}_{0}^{-1}-\mathbf{\Sigma}_{0}^{-1} \mathbf{X}\left(\mathbf{X}^{\prime} \boldsymbol{\Sigma}_{0}^{-1} \mathbf{X}\right)^{-1} \mathbf{X}^{\prime} \boldsymbol{\Sigma}_{0}^{-1}=\left[\begin{array}{ll}
(1), & \text { (2) } \\
(2)^{\prime}, & \text { (3) }
\end{array}\right]
$$

where (1), (2), (3) are obtained analogously as $\mathbf{P}_{11}, \mathbf{P}_{12}, \mathbf{P}_{22}$ in the proof of Theorem 2.2

$$
\begin{aligned}
& \text { (1) }=\mathbf{C}_{1, \sigma_{01}^{2} \mathbf{H}_{1} \cdot \mathbf{x}_{1}}+\mathbf{H}_{1}^{-1} \mathbf{X}_{1}\left(\mathbf{X}_{1}^{\prime} \mathbf{H}_{1}^{-1} \mathbf{X}_{1}\right)^{-1} \mathbf{C}^{\prime} \mathbf{C}_{1 \sigma_{01}^{2} \mathbf{H}_{1}, \mathbf{X}_{1}} \mathbf{C}\left(\mathbf{X}_{1}^{\prime} \mathbf{H}_{1}^{-1} \mathbf{X}_{1}\right)^{-1} \mathbf{X}_{1}^{\prime} \mathbf{H}_{1}^{-1}, \\
& \mathbf{C}_{1 . \sigma_{01}^{2} \mathbf{H}_{1} \cdot \mathbf{X}_{1}}=\sigma_{01}^{-2}\left(\mathbf{H}_{1}^{-1}-\mathbf{H}_{1}^{-1} \mathbf{X}_{1}\left(\mathbf{X}_{1}^{\prime} \mathbf{H}_{1}^{-1} \mathbf{X}_{1}\right)^{-1} \mathbf{X}_{1}^{\prime} \mathbf{H}_{1}^{-1}\right)\left(=\sigma_{01}^{-2} \mathbf{C}_{1 . \mathbf{H}_{1}} \cdot \mathbf{X}_{1}\right), \\
& \mathbf{C}_{1 . \mathbf{K}_{2} \cdot \mathbf{x}_{2}}=\mathbf{K}_{2}^{-1}-\mathbf{K}_{2}^{-1} \mathbf{X}_{2}\left(\mathbf{X}_{2}^{\prime} \mathbf{K}_{2}^{-1} \mathbf{X}_{2}\right)^{-1} \mathbf{X}_{2}^{\prime} \mathbf{K}_{2}^{-1}, \\
& \mathbf{K}_{2}=\sigma_{01}^{2} \mathbf{C}\left(\mathbf{X}_{1}^{\prime} \mathbf{H}_{1}^{-1} \mathbf{X}_{1}\right)^{-1} \mathbf{C}^{\prime}+\sigma_{02}^{2} \mathbf{H}_{2}, \\
& \text { (2) }=-\mathbf{H}_{1}^{-1} \mathbf{X}_{1}\left(\mathbf{X}_{1}^{\prime} \mathbf{H}_{1}^{-1} \mathbf{X}_{1}\right)^{-1} \mathbf{C}^{\prime} \mathbf{C}_{1 . \mathbf{K}_{2}} \cdot \mathbf{X}_{2} \text {, } \\
& \text { (3) }=\mathbf{C}_{1 . \mathbf{K}_{2}} \cdot \mathbf{x}_{2} \text {. }
\end{aligned}
$$

Furthermore

$$
\begin{aligned}
& \begin{array}{l}
\left(\mathbf{M} \boldsymbol{\Sigma}_{0} \mathbf{M}\right)^{+} \mathbf{V}_{1}\left(\mathbf{M} \boldsymbol{\Sigma}_{0} \mathbf{M}\right)^{+}=\left[\begin{array}{ll}
\text { (1) } \mathbf{H}_{1}(1), & \text { (1) } \boldsymbol{H}_{1}(2) \\
\text { (2) } \mathbf{H}_{1}(1), & \text { (2) } \mathbf{H}_{1}(2)
\end{array}\right] \\
\left(\mathbf{M} \boldsymbol{\Sigma}_{0} \mathbf{M}\right)^{+} \mathbf{V}_{2}\left(\mathbf{M} \boldsymbol{\Sigma}_{0} \mathbf{M}\right)^{+}=\left[\begin{array}{ll}
\text { (2) } \mathbf{H}_{2}(2)^{\prime}, & \text { (2) } \mathbf{H}_{2}(3) \\
\text { (3) } \mathbf{H}_{2}(2){ }^{\prime}, & \text { (3) } \boldsymbol{H}_{2}(3)
\end{array}\right\} \Rightarrow
\end{array} \\
& \hat{\gamma}_{1}=\boldsymbol{Y}^{\prime}\left(\mathbf{M} \Sigma_{0} \mathbf{M}\right)^{+} \mathbf{V}_{1}\left(\mathbf{M} \boldsymbol{\Sigma}_{0} \mathbf{M}\right)^{+} \boldsymbol{Y}=\sigma_{01}{ }^{4}\left(n_{1}-k_{1}\right) \hat{\sigma}_{1}^{2}\left(\boldsymbol{Y}_{1}\right)+\left[\boldsymbol{Y}_{2}-\mathbf{C} \hat{\boldsymbol{\beta}}_{1}\left(\boldsymbol{Y}_{1}\right)\right]^{\prime} . \\
& \text {. } \mathbf{C}_{1 . \mathrm{K}_{2} \cdot \mathrm{x}_{2}} \mathbf{C}\left(\mathrm{X}_{1}^{\prime} \mathbf{H}_{1}^{-1} \mathbf{X}_{1}\right)^{1} \mathbf{C}^{\prime} \mathbf{C}_{1 . \mathrm{K}_{2} \cdot \mathrm{X}_{2}}\left[\boldsymbol{Y}_{2}-\mathbf{C} \hat{\boldsymbol{\beta}}_{1}\left(\boldsymbol{Y}_{1}\right)\right], \\
& \hat{\gamma}_{2}=\boldsymbol{Y}^{\prime}\left(\mathbf{M} \boldsymbol{\Sigma}_{0} \mathbf{M}\right)^{+} \mathbf{V}_{2}\left(\mathbf{M} \boldsymbol{\Sigma}_{0} \mathbf{M}\right)^{+} \boldsymbol{Y}=\left[\boldsymbol{Y}_{2}-\mathbf{C} \hat{\boldsymbol{\beta}}_{1}\left(\boldsymbol{Y}_{1}\right)\right]^{\prime} \mathbf{C}_{1, \mathrm{~K}_{2} \cdot \mathbf{x}_{2}} \mathbf{H}_{2} \mathbf{C}_{1, \mathbf{K}_{2}} \cdot \mathbf{x}_{2} . \\
& \cdot\left[\boldsymbol{Y}_{2}-\mathbf{C} \hat{\boldsymbol{\beta}}_{1}\left(\boldsymbol{Y}_{1}\right)\right],
\end{aligned}
$$

$$
\begin{aligned}
& \operatorname{Tr}\left[\left(\mathbf{M} \Sigma_{0} \mathbf{M}\right)^{+} \mathbf{V}_{1}\left(\mathbf{M} \Sigma_{0} \mathbf{M}\right)^{+} \mathbf{V}_{1}\right]=\operatorname{Tr}\left[(1) \mathbf{H}_{1}(1) \mathbf{H}_{1}\right]=\sigma_{01}^{-4}\left(n_{1}-k_{1}\right)+\sigma_{01}^{-4} \operatorname{Tr}\left(\mathbf{R}^{2}\right), \\
& \operatorname{Tr}\left[\left(\mathbf{M} \Sigma_{0} \mathbf{M}\right)^{+} \mathbf{V}_{1}\left(\mathbf{M} \Sigma_{0} \mathbf{M}\right)^{+} \mathbf{V}_{2}\right]=\operatorname{Tr}\left[(2) \mathbf{H}_{1}(2) \mathbf{H}_{2}\right]=\sigma_{01}^{-2} \sigma_{02}^{-2}\left[\operatorname{Tr}(\mathbf{R})-\operatorname{Tr}\left(\mathbf{R}^{2}\right)\right], \\
& \operatorname{Tr}\left[\left(\mathbf{M} \Sigma_{0} \mathbf{M}\right)^{+} \mathbf{V}_{2}\left(\mathbf{M} \Sigma_{0} \mathbf{M}\right)^{+} \mathbf{V}_{2}\right]=\operatorname{Tr}\left[(3) \mathbf{H}_{2}(3) \mathbf{H}_{2}\right]= \\
&=\sigma_{20}^{-4}\left[n_{2}-k_{2}-2 \operatorname{Tr}(\mathbf{R})+\operatorname{Tr}\left(\mathbf{R}^{2}\right)\right], \\
& \mathbf{S}_{\left(\mathbf{M} \Sigma_{0} \mathbf{M}\right)^{+}}=\left[\begin{array}{ll}
\sigma_{01}^{-4}\left[n_{1}-k_{1}+\operatorname{Tr}\left(\mathbf{R}^{2}\right)\right], & \sigma_{01}^{-2} \sigma_{02}^{-2}\left[\operatorname{Tr}(\mathbf{R})-\operatorname{Tr}\left(\mathbf{R}^{2}\right)\right] \\
\sigma_{01}^{-2} \sigma_{02}^{-2}\left[\operatorname{Tr}(\mathbf{R})-\operatorname{Tr}\left(\mathbf{R}^{2}\right)\right], & \sigma_{22}^{-4}\left[n_{2}-k_{2}-2 \operatorname{Tr}(\mathbf{R})+\operatorname{Tr}\left(\mathbf{R}^{2}\right)\right]
\end{array}\right] .
\end{aligned}
$$

With respect to Lemma 1.2 the $\left(\sigma_{01}^{2}, \sigma_{02}^{2}\right)$-LMVQUIE of the vector $\left(\sigma_{1}^{2}, \sigma_{2}^{2}\right)^{\prime}$ is

$$
\left[\begin{array}{c}
\hat{\sigma}_{1}^{2}\left(\boldsymbol{Y}_{1}, \boldsymbol{Y}_{2}\right) \\
\hat{\boldsymbol{\sigma}}_{2}^{2}\left(\boldsymbol{Y}_{1}, \boldsymbol{Y}_{2}\right)
\end{array}\right]=\mathbf{S}_{\left(\mathbf{M} \mathbf{E}_{0} \mathbf{M}\right)^{+}}^{-1}\left[\begin{array}{c}
\hat{\gamma}_{1} \\
\hat{\gamma}_{2}
\end{array}\right] .
$$

After substituting and rearranging this we obtain the assertion 2.
For statement 3 see [6].
Remark 2.2 Let the ratio $\varrho=\sigma_{1}^{2} / \sigma_{2}^{2}$ be known. Then the UMVQUIEs $\hat{\sigma}_{1}^{2}\left(\boldsymbol{Y}_{1}, \boldsymbol{Y}_{2}\right)\left(=\varrho \hat{\sigma}_{2}^{2}\left(\boldsymbol{Y}_{1}, \boldsymbol{Y}_{2}\right)\right)$ and $\hat{\sigma}_{2}^{2}\left(\boldsymbol{Y}_{1}, \boldsymbol{Y}_{2}\right)$ can be easily derived. The expression for $\sigma_{2}^{2}\left(\boldsymbol{Y}_{1}, \boldsymbol{Y}_{2}\right)$ is an analogy of the expression for $\hat{\sigma}_{1}^{2}\left(\boldsymbol{Y}_{1}\right)$ from 1 of Theorem 2.3.

Remark 2.3. If $n_{1}=k_{1} \& \mathscr{M}(\mathbf{C}) \not \subset \mathscr{M}\left(\mathbf{X}_{2}\right) \& n_{2}>k_{2}$, then the relations for $\hat{\sigma}_{1}^{2}\left(\boldsymbol{Y}_{1}, \boldsymbol{Y}_{2} \mid \sigma_{01}^{2}, \sigma_{02}^{2}\right)$ and $\hat{\sigma}_{2}^{2}\left(\boldsymbol{Y}_{1}, \boldsymbol{Y}_{2} \mid \sigma_{01}^{2}, \sigma_{02}^{2}\right)$ in Theorem 2.3 do not contain the expression $\hat{\sigma}_{( }^{2}\left(\boldsymbol{Y}_{1}\right)$ which is impossible to be determined. Nevertheless, the estimators $\hat{\sigma}_{1}^{2}\left(\boldsymbol{Y}_{1}, \boldsymbol{Y}_{2} \mid \sigma_{01}^{2}, \sigma_{02}^{2}\right)$ and $\sigma_{2}^{2}\left(\boldsymbol{Y}_{1}, \boldsymbol{Y}_{2} \mid \sigma_{01}^{2}, \sigma_{02}^{2}\right)$ exist.

Remark 2.4. The matrices $\mathbf{K}^{(t)}$ from Lemma 1.1 and $\mathbf{S}_{\left(\mathbf{M} \Sigma_{0} \mathbf{M}\right)^{+}}$from Lemma 1.2 are simultaneously either regular or singular. The regularity of the matrix $\mathbf{K}^{(I)}$ was proved in Theorem 2.2. The regularity of the matrix $\mathbf{S}_{\left(\mathrm{ME}_{0} \mathbf{M}\right)^{+}}$(from Theorem 2.3) can be directly proved if $n_{1}>k_{1}$.

Denote $\mathbf{S}_{1}=\sigma_{01}^{2} \mathbf{C}\left(\mathbf{X}_{1}^{\prime} \mathbf{H}_{1}^{-1} \mathbf{X}_{1}\right)^{-1} \mathbf{C}^{\prime}(\neq \mathbf{0}), \quad \mathbf{S}_{2}=\sigma_{02}^{2} \mathbf{H}_{2} \quad\left(\mathbf{S}_{2}\right.$ is regular), $\mathbf{K}_{2}=\mathbf{S}_{1}+\mathbf{S}_{2}$ ( $\mathbf{K}_{2}$ is regular). Express the matrix $\mathbf{C}_{1, \mathbf{K}_{2} \cdot \mathbf{x}_{2}}$ in its factorized form $\mathbf{C}_{1, \mathbf{K}_{2} \cdot \mathbf{x}_{2}}=\mathbf{J} \mathbf{J}^{\prime}$, where $\mathbf{J}$ is of the type $n_{2} \times R\left(\mathbf{C}_{1 . \mathbf{K}_{2} \cdot \mathbf{x}_{2}}\right)$ and $R\left(\mathbf{C}_{1, \mathbf{K}_{2} \cdot \mathbf{x}_{2}}\right)=n_{2}-k_{2}$. Then in the Hilbert space $\mathscr{S}_{n_{2}-k_{2}}$ of symmetric $\left(n_{2}-k_{2}\right) \times\left(n_{2}-k_{2}\right)$ matrices with the inner product $\langle\mathbf{A}, \mathbf{B}\rangle=\operatorname{Tr}(\mathbf{A B}), \mathbf{A}, \mathbf{B} \in \mathscr{S}_{n_{2}-k_{2}}$, the Gram matrix $\mathbf{G}$ of the couple $\mathbf{J}^{\prime} \mathbf{S}_{1} \mathbf{J}$ and $\mathbf{J}^{\prime} \mathbf{S}_{2} \mathbf{J}$ is

$$
\mathbf{G}=\left[\begin{array}{ll}
\left\langle\mathbf{J}^{\prime} \mathbf{S}_{1} \mathbf{J}, \mathbf{J}^{\prime} \mathbf{S}_{\mathbf{1}} \mathbf{J}\right\rangle, & \left\langle\mathbf{J}^{\prime} \mathbf{S}_{\mathbf{1}} \mathbf{J}, \mathbf{J}^{\prime} \mathbf{S}_{\mathbf{2}} \mathbf{J}\right\rangle \\
\left\langle\mathbf{J}^{\prime} \mathbf{S}_{2} \mathbf{J}, \mathbf{J}^{\prime} \mathbf{S}_{1} \mathbf{J}\right\rangle, & \left\langle\mathbf{J}^{\prime} \mathbf{S}_{2} \mathbf{J}, \mathbf{J}^{\prime} \mathbf{S}_{2} \mathbf{J}\right\rangle
\end{array}\right] .
$$

It can be easily proved that

$$
\mathbf{G}+\left[\begin{array}{cc}
n_{1}-k_{1}, & 0 \\
0, & 0
\end{array}\right]=\mathbf{S}_{\left(\mathbf{M} \Sigma_{0} \mathbf{M}\right)^{+}} .
$$

The regularity of the matrix $\mathbf{J}^{\prime} \mathbf{S}_{2} \mathbf{J}$ implies $\left\langle\mathbf{J}^{\prime} \mathbf{S}_{2} \mathbf{J}, \mathbf{J}^{\prime} \mathbf{S}_{2} \mathbf{J}\right\rangle=\sigma_{02}^{-4}\left[n_{2}-k_{2}-\right.$ $\left.-2 \operatorname{Tr}(\mathbf{R})+\operatorname{Tr}\left(\mathbf{R}^{2}\right)\right]>0$. The matrix $\mathbf{G}$ is always positive semidefinite and $n_{1}-k_{1}>0$, thus the matrix $\mathbf{S}_{\left(\mathrm{ME}_{0} \mathrm{M}\right)^{+}}$is regular.

Remark 2.5. Theorems 2.1, 2.2 and 2.3 enable us to determine the sequence

$$
\begin{gathered}
\hat{\boldsymbol{\beta}}_{1}\left(\boldsymbol{Y}_{1}\right), \hat{\sigma}_{1}^{2}\left(\boldsymbol{Y}_{1}\right), \sigma_{2}^{2}\left[\hat{\boldsymbol{\beta}}_{1}\left(\boldsymbol{Y}_{1}\right), \hat{\sigma}_{1}^{2}\left(\boldsymbol{Y}_{1}\right), \boldsymbol{Y}_{2}\right]= \\
=\hat{\sigma}_{2}^{2}\left[\boldsymbol{Y}_{1}, \boldsymbol{Y}_{2} \mid \hat{\sigma}_{1}^{2}\left(\boldsymbol{Y}_{1}\right), \sigma_{02}^{2}\right], \hat{\boldsymbol{\beta}}_{2}\left\{\hat{\boldsymbol{\beta}}_{1}\left(\boldsymbol{Y}_{1}\right), \boldsymbol{Y}_{2}, \hat{\sigma}_{1}^{2}\left(\boldsymbol{Y}_{1}\right), \hat{\sigma}_{2}^{2}\left[\boldsymbol{Y}_{1}, \boldsymbol{Y}_{2} \mid \hat{\sigma}_{1}^{2}\left(\boldsymbol{Y}_{1}\right), \sigma_{02}^{2}\right]\right\}, \ldots
\end{gathered}
$$

Instead of the estimator $\hat{\sigma}_{2}^{2}\left[\boldsymbol{Y}_{1}, \boldsymbol{Y}_{2} \mid \hat{\sigma}_{1}^{2}\left(\boldsymbol{Y}_{1}\right), \sigma_{02}^{2}\right]$ the estimator obtained iteratively can be used; for the value $\sigma_{02}^{2}$ we substitute $\hat{\sigma}_{2}^{2}\left[\boldsymbol{Y}_{1}, \boldsymbol{Y}_{2} \mid \hat{\sigma}_{1}^{2}\left(\boldsymbol{Y}_{1}\right), \sigma_{02}^{2}\right]$ and repeat this procedure several times.

Remark 2.6 The mean values of the following quadratic forms of the vectors $\boldsymbol{Y}_{1}$ and $\boldsymbol{Y}_{2}$, frequently occurring in practice, are interesting (the notation from Theorem 2.3 is used):
(a) $E\left(\boldsymbol{v}_{2}^{\prime} \mathbf{K}_{2}^{-1} \boldsymbol{v}_{2} \mid \sigma_{1}^{2}, \sigma_{2}^{2}\right)=\sigma_{1}^{2} \operatorname{Tr}(\mathbf{R}) / \sigma_{01}^{2}+\sigma_{2}^{2}\left[n_{2}-k_{2}-\operatorname{Tr}(\mathbf{R})\right] / \sigma_{02}^{2}$,
(b) $E\left(\boldsymbol{V}_{2}^{\prime} \mathbf{K}_{2}^{-1} \mathbf{H}_{2} \mathbf{K}_{2}^{-1} \boldsymbol{V}_{2} \mid \sigma_{1}^{2}, \sigma_{2}^{2}\right)=\sigma_{1}^{2}\left[\operatorname{Tr}(\mathbf{R})-\operatorname{Tr}\left(\mathbf{R}^{2}\right)\right] /\left(\sigma_{01}^{2} \sigma_{02}^{2}\right)+$
$+\sigma_{2}^{2}\left[n_{2}-k_{2}-2 \operatorname{Tr}(\mathbf{R})+\operatorname{Tr}\left(\mathbf{R}^{2}\right)\right] / \sigma_{02}^{4}$.
Denote $\widetilde{\boldsymbol{\beta}}_{2}=\left(\mathbf{X}_{2}^{\prime} \mathbf{H}_{2}^{-1} \mathbf{X}_{2}\right)^{-1} \mathbf{X}_{2}^{\prime} \mathbf{H}_{2}^{-1}\left[\boldsymbol{Y}_{2}-\mathbf{C} \hat{\boldsymbol{\beta}}_{1}\left(\boldsymbol{Y}_{1}\right)\right], \tilde{\boldsymbol{V}}_{2}=\boldsymbol{Y}_{2}-\mathbf{C} \hat{\boldsymbol{\beta}}_{1}\left(\boldsymbol{Y}_{1}\right)-\mathbf{X}_{2} \tilde{\boldsymbol{\beta}}_{2}$. Then
(c) $E\left(\tilde{\mathbf{V}}_{2}^{\prime} \mathbf{H}_{2}^{-1} \tilde{\mathbf{V}}_{2} \mid \sigma_{1}^{2}, \sigma_{2}^{2}\right)=\sigma_{1}^{2} \operatorname{Tr}\left[\mathbf{C}_{1 . \mathbf{H}_{2}, \mathbf{x}_{2}} \mathbf{C}\left(\mathbf{X}_{1}^{\prime} \mathbf{H}_{1}^{-1} \mathbf{X}_{1}\right)^{-1} \mathbf{C}^{\prime}\right]+\sigma_{2}^{2}\left(n_{2}-k_{2}\right)$.

This shows that none of the forms (a), (b) and (c) can be used alone for the estimation of the variance component $\sigma_{2}^{2}$. An exception is the case $\mathscr{M}(\mathbf{C}) \subset$ $\subset \mathscr{M}\left(\mathbf{X}_{2}\right) \Rightarrow \mathbf{R}=\mathbf{0} \& \mathbf{C}_{1 . \mathbf{H}_{2} \cdot \mathbf{x}_{2}} \mathbf{C}\left(\mathbf{X}_{1}^{\prime} \mathbf{H}_{1}^{-1} \mathbf{X}_{1}\right)^{-1} \mathbf{C}^{\prime}=\mathbf{0}$ (in detail see [6] and [7]).

Remark 2.7. Estimates of $\sigma_{1}^{2}$ and $\sigma_{2}^{2}$ from theorem 2.3, cases 1. and 3, are always positive. This is not true in the case 2 . The probability of obtaining the negative estimates in this case decreases with increasing $n_{1}$ and $n_{2}$. As an evaluation of the exact value of this probability in an actual case is difficult, a simulation study was made. It was found that $n_{i}-k_{i}>20, i=1,2$, was sufficient for obtaining an acceptable small value of this probability.

## ДВУХЭТАПНАЯ РЕГРЕССИОННАЯ МОДЕЛЬ

## Lubomir Kubáček

## Резюме

Регрессионная модель $\boldsymbol{Y} \sim N_{n}(\boldsymbol{X} \boldsymbol{\beta}, \boldsymbol{\Sigma})$ называется регулярной двухэтапной, если $\boldsymbol{Y}=$ $=\left(\boldsymbol{Y}_{1}^{\prime}, \boldsymbol{Y}_{2}^{\prime}\right)^{\prime}, \mathbf{X}=\left[\begin{array}{cc}\mathbf{X}_{1}, & \mathbf{0} \\ \mathbf{C}, & \mathbf{X}_{2}\end{array}\right], \boldsymbol{\beta}=\left(\boldsymbol{\beta}_{1}^{\prime}, \boldsymbol{\beta}_{2}^{\prime}\right)^{\prime}, \mathbf{\Sigma}=\sigma_{1}^{2}\left[\begin{array}{cc}\mathbf{H}_{1}, & \mathbf{0} \\ \mathbf{0}, & \mathbf{0}\end{array}\right]+\sigma_{2}^{2}\left[\begin{array}{cc}\mathbf{0}, & \mathbf{0} \\ \mathbf{0}, & \mathbf{H}_{2}\end{array}\right] ;$ здесь $\mathbf{X}_{i}-n_{1} \times k_{i}$ матрица, имеющая полный ранг в столбцах, $i=1,2, \mathbf{C} \neq \mathbf{0}$, а $\mathbf{H}_{i}-n_{i} \times n_{i}$ положительно определенная матрица, $i=1,2$. Существует только одна последовательность, допустимая для определения оценок неизвестных параметров $\boldsymbol{\beta}_{i} \in \mathscr{R}^{k_{i}}$ (пространство Евклида размерности $\left.k_{1}\right), \sigma_{i}^{2} \in(0, \infty), i=1,2$; эта последовательность указана в статье. Получены локально (или равномерно) наилучшие оценки этих параметров и показаны условия их существования.
