# ON A MAXIMAL DISTANCE BETWEEN GRAPHS 

Michal Šabo, Bratislava

(Received January 25, 1989)

In [1], [2] some type of a metric for graphs was introduced. This type of a metric is based on the notion of maximal common subgraph (MCS). It is convenient e.g. for mathematical modelling oí organic chemistry. This paper deals with the problem of a maximal distance between graphs in a given family of graphs. At the end of the paper, some problems of this theory are listed.

## 1. PRELIMINARIES

A graph $G=(V, E)$ consists of a non-empty finite vertex set $V$ and edge set $E$. The graphs considered here are undirected without loops and multiple edges. A subgraph $H$ of the graph $G$ is a graph obtained from $G$ by deleting some edges and vertices, $H \subseteq G$. Every edge $x \in E$ can be written by $x=(u, v)$, where $u, v \in V$ are vertices connected by the edge $x$. Two graphs $G_{1}=\left(V_{1}, E_{1}\right)$ and $G_{2}=\left(V_{2}, E_{2}\right)$ are isomorphic iff there exists $1-1$ correspondence $f: V_{1} \rightarrow V_{2}$ such that $(u, v) \in E_{1}$ if and only if $(f(u), f(v)) \in E_{2}, G_{1} \cong G_{2}$.

A graph $G$ is the common subgraph of the graphs $G_{1}, G_{2}$ iff there exist $H_{1}, H_{2}$ such that $H_{1} \subseteq G_{1}, H_{2} \subseteq G_{2}$ and $H_{1} \cong G, H_{2} \cong G$. A maximal common subgraph (MCS) is the common subgraph which contains the maximal number of edges.

The distance of the graphs $G_{1}=\left(V_{1}, E_{1}\right)$ and $G_{2}=\left(V_{2}, E_{2}\right)$ is defined by

$$
d\left(G_{1}, G_{2}\right)=\left|E_{1}\right|+\left|E_{2}\right|-2\left|E_{1,2}\right|+\left|\left|V_{1}\right|-\left|V_{2}\right|\right|,
$$

where $\left|E_{1}\right|,\left|E_{2}\right|,\left|V_{1}\right|,\left|V_{2}\right|$ are cardinalities of the edge sets and vertex sets respectively and $\left|E_{1,2}\right|$ is the number of edges of MCS.

Let $\mathscr{F}_{p, q}$ be the family of all graphs with $p$ vertices and $q$ edges. It is clear that for $G_{1}, G_{2} \in \mathscr{F}_{p, q}$

$$
\dot{d}\left(G_{1}, G_{2}\right)=2 q-2\left|E_{1,2}\right| .
$$

If we identify the isomorphic graphs then $\mathscr{F}_{p, q}$ with the distance $d$ is a metric space.
Without loss of generality we can suppose that all graphs in $\mathscr{F}_{p, q}$ have the same vertex set $V$.

## 2. DIAMETER OF A FAMILY OF GRAPHS

We define

$$
\operatorname{diam} \mathscr{F}_{p, q}=\max \left\{d(G, H) ; G, H \in \mathscr{F}_{p, q}\right\}
$$

Evidently, $\operatorname{diam} \mathscr{F}_{p, 0}=\operatorname{diam} \mathscr{F}_{p, 1}=0$. We shall try to find out or to estimate diam $\mathscr{F}_{p, q}$ for arbitrary $p, q$. We remark that

$$
0 \leqq q \leqq\binom{ p}{2}
$$

Theorem 1. Let $G_{1}, G_{2} \in \mathscr{F}_{p, q}$, where $q \geqq 1$. Then

$$
d\left(G_{1}, G_{2}\right) \leqq 2 q-2
$$

Proof. MCS of the graphs $G_{1}$ and $G_{2}$ contains at least one edge.
The consequence of this theorem is: $\operatorname{diam} \mathscr{F}_{p, q} \leqq 2 q-2$.
Theorem 2. Let $q \geqq$. Then $\operatorname{diam} \mathscr{F}_{p, q}=2 q-2$ iff $q \leqq \frac{1}{2} p$.
Proof. Let $q \leqq \frac{1}{2} p$ and $V=\left\{v_{1}, v_{2}, \ldots, v_{p}\right\}$. We construct $G_{1}=\left(V, E_{1}\right), G_{2}=$ $=\left(V, E_{2}\right)$, where

$$
\begin{aligned}
& E_{1}=\left\{\left(v_{1}, v_{2}\right),\left(v_{1}, v_{3}\right), \ldots,\left(v_{1}, v_{q+1}\right)\right\}, \\
& E_{2}=\left\{\left(v_{1}, v_{2}\right),\left(v_{3}, v_{4}\right), \ldots,\left(v_{2 q-1} v_{2 q}\right)\right\} .
\end{aligned}
$$

MCS of of these graphs consist of one edge only. Therefore $d\left(G_{1}, G_{2}\right)=2 q-2$. Usirg Theorem 1 we have diam $\mathscr{F}_{p, q}=2 q-2$. Conversely, let diam $\mathscr{F}_{p, q}=2 q-2$ and let $q>\frac{1}{2} p$. Then for any $G_{1}, G_{2} \in \mathscr{F}_{p, q}$ we have $\sum \operatorname{deg} v_{i}=2 q>p$, where $\operatorname{deg} v_{i}$ is number of edges incident with the vertex $v_{i}$. It implies the existence of vertices $u, v$ such that $\operatorname{deg} u \geqq 2$ in $G_{1}$ and $\operatorname{deg} v \geqq 2$ in $G_{2}$. Then MCS of the graphs $G_{1}, G_{2}$ contains at least iwo edges. Therefore $d\left(G_{1}, G_{2}\right) \leqq 2 q-4$ for any $G_{1}, G_{2} \in \mathscr{F}_{p, q}$. It contradicts the assumption.

Theorem 3. Let $\frac{1}{2} p<q \leqq p-1$. Then diam $\mathscr{F}_{p, q}=2 q-4$.
Proof. Theorem 2 implies that diam $\mathscr{F}_{p, q}<2 q-2$. We construct $G_{1}=\left(V, E_{1}\right)$, $G_{2}=\left(V, E_{2}\right)$ such that

$$
\begin{aligned}
& E_{1}=\left\{\left(v_{1}, v_{2}\right),\left(v_{1}, v_{3}\right), \ldots,\left(v_{1}, v_{q+1}\right)\right\}, \\
& E_{2}=\left\{\left(v_{1}, v_{2}\right),\left(v_{2}, v_{3}\right), \ldots,\left(v_{q}, v_{q+1}\right)\right\} .
\end{aligned}
$$

Then $G_{1}, G_{2} \in \mathscr{F}_{p, q}$ and their MCS contains two edges only. Therefore $d\left(G_{1}, G_{2}\right)=$ $=2 q-4$. It implies $2 q-4 \leqq \operatorname{diam} \mathscr{F}_{p, q}$. It proves that diam $\mathscr{F}_{p, q}=2 q-4$.

A complement of the graph $G=(V, E)$ is a gıaph $\bar{G}=(V, \bar{E})$ which contains just the cdges which don't belong to $E$. It is clear that $|E|+|\bar{E}|=\frac{1}{2} p(p-1)$. In [3], it was proved:

Theorem 4. For arbitrary graphs $G, H$ with the same number of vertices the following holds: $d(G, H)=d(\bar{G}, \bar{H})$.

Theorem 5. If we denote $\bar{q}=\frac{1}{2} p(p-1)-q$ then

$$
\operatorname{diam} \mathscr{F}_{p, q}=\operatorname{diam} \mathscr{F}_{p, \bar{q}}
$$

Theorem 6. Let $q \geqq \frac{1}{2} p(p-2)$. Then

$$
\operatorname{diam} \mathscr{F}_{p, q}=p(p-1)-2 q-2 .
$$

Proof. If $q \geqq \frac{1}{2} p(p-2)$ then

$$
\bar{q}=\frac{p}{2}(p-1)-q \leqq \frac{p}{2}(p-1)-\frac{p}{2}(p-2)=\frac{p}{2} .
$$

Using Theorem 2 and Theorem 5 we get

$$
\operatorname{diam} \mathscr{F}_{p, q}=\operatorname{diam} \mathscr{F}_{p, \bar{q}}=2 \bar{q}-2=p(p-1)-2 q-2 .
$$

Theorem 7. Let

$$
\binom{p-1}{2} \leqq q<\frac{p}{2}(p-2)
$$

Then

$$
\operatorname{diam} \mathscr{F}_{p, q}=p(p-1)-2 q-4
$$

Proof. The inequality

$$
\binom{p-1}{2} \leqq q<\frac{p}{2}(p-2)
$$

follows $\frac{1}{2} p<\bar{q} \leqq p-1$. Then

$$
\operatorname{diam} \mathscr{F}_{p, q}=\operatorname{diam} \mathscr{F}_{p, \bar{q}}=2 \bar{q}-4=p(p-1)-2 q-4 .
$$

## PROBLEMS

It would be interesting to solve some problems connected with the notion of distance and diameter. We found out

$$
\operatorname{diam} \mathscr{F}_{p, q} \text { for } \quad q \leqq p-1 \quad \text { or } \quad q \geqq\binom{ p-1}{2}
$$

It implies that we know all diam $\mathscr{F}_{p, q}$ for $p \leqq 4$.
Problem 1. How to find out or estimate diam $\mathscr{F}_{p, q}$ for

$$
4<p \leqq q<\binom{p-1}{2} ?
$$

The next problems are connected with the problems of distance between graphs with the sanme number of vertices and different number of edges.

Problem 2. If $G_{1} \in \mathscr{F}_{p, q}, G_{2} \in \mathscr{F}_{p, q_{2}}, q_{1}, q_{2} \geqq 1$ then

$$
d\left(G_{1}, G_{2}\right) \leqq q_{1}+q_{2}-2 .
$$

Under which conditions the equality holds?

Problem 3. Obviously,

$$
\operatorname{diam}\left(\mathscr{F}_{p, q_{1}} \cup \mathscr{F}_{p, q_{2}}\right) \geqq \max \left(\operatorname{diam} \mathscr{F}_{p, q_{1}}, \operatorname{diam} \mathscr{F}_{p, q_{2}}\right) .
$$

For which $p, q_{1}, q_{2}$
a) $\operatorname{diam}\left(\mathscr{F}_{p, q_{1}} \cup \mathscr{F}_{p, q_{2}}\right)>\max \left(\operatorname{diam} \mathscr{F}_{p, q_{1}}, \operatorname{diam} \mathscr{F}_{p, q_{2}}\right)$,
b) $\operatorname{diam}\left(\mathscr{F}_{p, q_{1}} \cup \mathscr{F}_{p, q_{2}}\right)=\max \left(\operatorname{diam} \mathscr{F}_{p, q_{1}}, \operatorname{diam} \mathscr{F}_{p, q_{2}}\right)$ ?

Problem 4. Is any relation between $\operatorname{diam}\left(\mathscr{F}_{p, q_{1}} \cup \mathscr{F}_{p, q_{2}}\right)$ and $\operatorname{diam} \mathscr{F}_{p, q_{1}}+$ $+\operatorname{diam} \mathscr{F}_{p, q_{2}}$ ? Are there any non-trivial $p, q_{1}, q_{2}$ such that these numbers are the same?

Problem 5. Prove or reject the conjecture: If

$$
q_{1} \leqq q_{2} \leqq \frac{1}{2} \frac{p}{2}(p-1)
$$

then $\operatorname{diam} \mathscr{F}_{p, q_{1}} \leqq \operatorname{diam} \mathscr{F}_{p, q_{2}}$.
The last problem deals with the distance of graphs which have different numbers of vertices and edges. It is clear

$$
d\left(G_{1}, G_{2}\right) \leqq q_{1}+q_{2}+\left|p_{1}-p_{2}\right|-2
$$

for $G_{1} \in \mathscr{F}_{p_{1}, q_{1}}, G_{2} \in \mathscr{F}_{p_{2}, q_{2}}, q_{1}, q_{2} \geqq 1$.
Problem 6. Under which conditions
a) $d\left(G_{1}, G_{2}\right)=q_{1}+q_{2}+\left|p_{1}-p_{2}\right|-2$,
b) $d\left(G_{1}, G_{2}\right)=q_{1}+q_{2}+\left|p_{1}-p_{2}\right|-4$ hold?

Remark. B. Zelinka [4] solved the problem of $\operatorname{diam} \mathscr{F}_{p}$, where $\mathscr{F}_{p}=\bigcup \mathscr{F}_{p, q}$ is the family of all graphs with $p$ vertices. He proved that diam $\mathscr{F}_{p}=\frac{1}{2} p(p-1)$.
