Abstract: Free entropic groupoids and free commutative medial groupoids are constructed.

Key words: Free groupoid, medial groupoid.
Classification: 20N99, 08B20

The theory of medial groupoids is (at least in the opinion of the authors) one of the deepest non-associative theories within the framework of groupoids. (Recall that a groupoid is said to be medial if it satisfies the identity $x y \cdot u v=x u \cdot y \nabla$ and a groupoid is said to be entropic if it is a homomorphic image of a medial cancellation groupoid.) In this paper, explicit constructions of free entropic and free commutative medial groupoids are presented. These constructions are realized by means of polynomials in at most two commuting indeterminates over the ring of integers.

1. Preliminaries. Let us $f i x$ two symbols, say $\alpha$ and $\beta$. We denote by $E$ the free monoid over $\{\alpha, \beta\}$. Every element $e \in E$ can be written in the form $e=a_{1} \ldots a_{n}, a_{i} \in\{\alpha, \beta\}$
and $n \geq 0$; the integer $n$ is denoted by $\delta(e)$. The unit element of $E$ is 1 and we have $\delta^{\prime}(1)=0$. For every $n \geq 0$, let $E_{n}=\left\{e \in E ; \quad \sigma^{\sim}(e)=n\right\}$.

Let $X$ be a non-empty set. Then $S W_{X}^{\prime}$ is the free algebra over $x$ in the variety of universal algebras of the type $\{+, 0, \alpha, \beta\}$ (consisting of one binary, one nullary and two mary operation symbols) satisfying the identities $(x+y)+$ $+y=x+(y+z), x+y=y+x, x+0=x, \quad \alpha(x+y)=\propto x+$ $+\alpha y, \beta(x+y)=\beta x+\beta y, \alpha 0=0, \beta 0=0$. Elements from $\mathrm{SW}_{\mathrm{X}}^{\circ}$ are called semiterms over X. Every semiterm can be expressed in the form $s=\sum_{i=1}^{M} e_{i} x_{i}$, where $r$ is a non-negative integer, $e_{i} \in E$ and $x_{i} \in X_{\text {; }}$ this expression is unique up to the order of the summands. We put $\lambda(s)=r$.

Define a multiplication on $\mathrm{SW}_{\mathrm{X}}^{\circ}$ by $\mathrm{st}=\alpha s+\beta \mathrm{t}$. The set $S W_{X}^{\circ}$ is a groupoid with respect to this operation and this groupoid will be denoted by $S W_{X}$. Let $W_{X}$ be the subgroupoid of $S W_{X}$ generated by $X$. Elements of $W_{X}$ are called terms over $X$. It is easy to check that $W_{X}$ is an absolutely free groupoid over X .

Let $t=\sum_{i} \sum_{1}^{r} e_{i} x_{i}$ be a term over $X$. The set $\left\{x_{i} ; 1 \leqslant i \leqslant r\right\}$ is denoted by $\operatorname{var}(t)$. The set $\left\{e_{i} ; 1 \leqslant i \leqslant r\right\}$ is denoted by $I^{*}(t)$. The set $\left\{e \in E ; e f \in I^{*}(t)\right.$ for some $\left.f \in E\right\}$ is denoted by $I(t)$. For every $n \geq 0$, put $I_{n}(t)=F_{n} \cap I(t)$. Finally, let $\sigma^{\sigma}(t)=\max \left\{\delta^{\prime}(e) ; e \in I(t)\right\}$.
1.1. Lemma. Let $t$ be a term over $X$. The set $P=I(t)$ has the following properties:
(1) $P$ is a finite subset of $E$ and $1 \in P$.
(2) If $e, f \in F$ and $e f \in P$ then $e \in P$.
(3) If éE then $\alpha \in P$ iff $\beta \in$ P.

Conversely, if $P$ is a subset of $E$ satisfying (1), (2) and (3) and $h$ is a mapping of the set $Q=\{e \in P ; e \alpha \notin P\}$ into $X$ then the semiterm $s=e \sum_{\epsilon} e_{Q}(e)$ is a term over $X$ and $P=I(s)$.

Proof. Easy (by induction on $\lambda(t)$ ).
Let $t$ be a term over $X$ and $e \in I(t)$. Then, as one may check easily, there exists a unique pair ( $w, u$ ) such that $w$ is a semiterm, u is a term and $t=w+$ eu. Moreover, if $v$ is a term then $w+e v$ is a term. We put $u=t_{[e]}$.

Let $e=a_{1} \ldots a_{n} \in E$. The ordered pair (Card $\left\{i ; a_{i}=\alpha\right\}$, Card $\left\{i ; a_{i}=\beta\right\}$ ) is called the weight of e. For every pair $(k, 1)$ of non-negative integers, denote by $\xi_{k, 1}$ the set of all $e \in E$ of weight $(k, I)$. For every $t \in W_{X}$, let $I_{k, 1}(t)=E_{k, 1} \cap$ $\cap I(t)$. Finally, put $P_{k, I}(x, t)=\operatorname{Card}\left\{e \in I_{k, I}(t) ; t_{[e]}=x\right\}$ for each $x \in X$.
1.2. Proposition. Let $X$ be a non-empty set. Denote by $M_{X}$ the least congruence of $W_{X}$ such that the corresponding factorgroupoid is a medial cancellation groupoid. Then ( $u, \nabla) \in$ $\in M_{X}$ iff $u, v \in W_{X}$ and $P_{k, 1}(x, u)=P_{k, 1}(x, v)$ for $\operatorname{a} 11 x \in X$ and $\mathbf{k}, 1 \geq 0$.

Proof. See [2].
For all $t \in W_{X}, x \in X$ and $n \geq 0$, put $P_{n}(x, t)=C a r d\{e \in$ $\left.\in I_{n}(t) ; t_{[e]}=x\right\}$ 。
1.3. Proposition. Let $X$ be a non-empty set. Denote by $C_{X}$ the least congruence of $W_{X}$ such that the corresponding factorgroupoid is a commutative medial groupoid. Then ( $u, v) \in$ $\in C_{X}$ iff $u, v \in W_{X}$ and $P_{n}(x, u)=P_{n}(x, v)$ for $a l l x \in X$ and $n \geq 0$.

Proof. See [2].

In the following, we shall make use of the numbers $\binom{\mathbf{n}}{\mathbf{k}}$. Recall that these are defined as follows: $\binom{n}{k}=0$ for all $n<0$ and every integer $k ;\binom{0}{0}=1 ;\binom{0}{k}=0$ for every $k \neq 0$; $\binom{n+1}{k}=\binom{n}{k-1}+\binom{n}{k}$ for all $n \geq 0$ and every integer $k$.
2. A construction of free entropic groupoids. Let $X$ be a non-empty set. Denote by $F_{X}^{\circ}$ the free algebra over $X$ in the variety of universal algebras of the type $\{+, 0, \alpha, \beta\}$ satisfying the identities $(x+y)+z=x+(y+z), x+y=y+$ $+\mathbf{x}, \mathbf{x}+0=\mathbf{x}, \alpha(\mathbf{x}+\mathbf{y})=\alpha \mathbf{x}+\infty \mathbf{y}, \beta(\mathbf{x}+\mathbf{y})=\beta \mathbf{x}+\beta \mathbf{y}$, $\alpha 0=0, \beta 0=0, \alpha \beta x=\beta \alpha x$. Every element $u \in F_{X}^{\prime}$ can be written in the form $u=\sum_{i=1}^{r} \alpha^{n_{i}} \beta^{m_{i}} x_{i}$ where $r, n_{i}, n_{i}$ are non-negative integers and $x_{i} \in X$; this expression is unique up to the order of the summands. We define a multiplication on $F_{X}^{0}$ by $u v=\alpha u+\beta v$. The set $F_{X}^{\prime}$ together with this operation is a groupoid which will be denoted by $F_{X}$. We can identify the set $F_{X}$ with a subset of $S W_{X}$. For every element $\mathbf{u}=\sum_{i=1}^{\pi} \alpha^{n_{i}} \beta^{m_{i}} x_{i}$ fron $F_{X}$, put $\sigma^{\prime}(u)=\max \left(n_{i}+n_{i}\right)$. This non-negative number is called the depth of u. Finally, denote by $G_{x}$ the subgroupoid of $F_{x}$ generated by $X$.
2.1. Theorem. Let $X$ be a non-empty set. Then the groupoid $G_{X}$ is a free entropic groupoid over $X$. An element $u=\sum_{i=1}^{M} \alpha^{n_{i}} \beta^{n_{i}} x_{i}$ fron $F_{X}$ belongs to $G_{X}$ iff the following two conditions are satisfied:
(1) If $0 \leqslant k \leq n \leq \sigma^{\prime}(u)$ then $\sum_{i=1}^{n}\binom{n-n_{i}-n_{i}}{k-n_{i}} \leq\left(\frac{n}{k}\right)$.
(2) If $0 \leqslant k \leqslant n=f^{n}(u)$ then $\sum_{i=1}^{n}\binom{n-n_{i}-m_{i}}{k-n_{i}}=\binom{n}{k}$.

The proof of this result will be divided into seven lemmas.
2.2. Lemma. Denote by $h$ the homomorphism of $W_{X}$ onto $G_{X}$ such that $h(x)=x$ for every $x \in X$. If $t \in \mathbb{W}_{X}$ then $h(t)=\sum_{e \in I^{*}(t)} \alpha^{l(e)} \beta^{r(e)} t_{[e]}$ where (l(e),r(e)) denotes the weight of $e$. For $u, v \in W_{X}, h(u)=h(v)$ iff $P_{k, 1}(x, u)=$ $=P_{k, 1}(x, v)$ for all $x \in X$ and $k, l \geq 0$.

Proof. The first assertion can be proved easily by induction on the length of $t$. The second assertion is an easy consequence.
2.3. Lemma. $G_{X}$ is a free entropic groupoid over $X$.

Proof. This is a consequence of 2.2 and 1.2 .
Let $u={ }_{i} \sum_{i=1}^{\mu} \alpha^{n_{i}} \beta^{m_{i}}{ }_{x_{i}} \in F_{X}$. Put $c(n, k, u)=$ $=\sum_{i=1}^{n}\binom{n-n_{i}-n_{i}}{k-n_{i}}$ for all integers $n$, $k$. Let $H_{X}$ designate the set of all $u \in F_{X}$ such that $c(n, k, u)=\left(\frac{n}{k}\right)$ whenever $0 \leqslant k \leqslant n=$ $=\sigma^{\prime}(u)$. Moreover, let $K_{X}$ be the set of all $u \in H_{X}$ such that $c(n, k, u) \leqslant\binom{ n}{k}$ whenever $0 \leq k \leq n \leq \sim(u)$.
2.4. Lemma. The following conditions are equivalent for every $u \in F_{X}$ :
(i) $u \in H_{X}$.
(ii) $c(n, k, u)=\binom{n}{k}$ for all $n \geq \delta(u)$ and $k$.
(iii) There exists $n \geq \delta^{\prime}(u)$ such that $c(n, k, u)=\left(\begin{array}{l}n \\ k\end{array}\right.$ for every $0 \leq k \leq \sigma^{\prime}(u)$.

Proof. (i) implies (ii). If either $k<0$ or $n>k$ then $c(n, k, u)=0=\binom{n}{k}$. Now, we shall proceed by induction on $m=n-\sigma^{\sim}(u)$. If $m=0$ then there is nothing to prove. Let $m \geq 1$. We have $\binom{n}{k}=\binom{n-1}{k-1}+\binom{n-1}{k}$ and $\binom{n-1}{k-1}=c(n-1, k-1, u)$, $\binom{n-1}{k}=c(n-1, k, u)$ by the induction hypothesis. The rest is clear.
(ii) implies (iii). This implication is evident.
(iii) implies (i). We can assume that $n>\sigma^{\prime}(u)$. Let us prove by induction on $0 \leqslant k \leq \sigma^{\prime}(u)$ that $c(n-1, k, u)=\binom{n-1}{k}$. For $k=0,1=c(n, 0, u)=\binom{n}{0}$, and hence $n_{i}=0$ for exactly one $1 \leq i \leq r$; for this $i$ we have $n-n_{i}-n_{i} \geq 1$, and so $c(n-1,0, u)=1=\binom{n-1}{0}$. Now, Let $k \geq 1$. Then $\binom{m-1}{k}=\binom{n}{k}-$ - $\left(\frac{n i n-1}{k-1}\right)=c(n, k, u)-c(n-1, k-1, u)=c(n-1, k, u)$. The rest is easy by induction on $n-\sigma(u)$.
2.5. Lemma. $c(n, k, u) \leq\left(\frac{n}{k}\right)$ for every $u \in K_{x}$ and all integers $\mathrm{n}, \mathrm{k}$.

Proof. The statement is clear, provided either $n<0$ or $n \geq 0$ and $k \notin\{0, \ldots, n\}$. Let $n \geq 0$ and $0 \leq k \leq n$. For $n \leq \delta^{\prime}(u)$, there is nothing to prove. For $n \geq \sigma^{\prime}(u)$, the assertion follows from 2.4.
2.6. Lemma. $G_{X} \subseteq K_{X}$.

Proof. Since $X \subseteq K_{X}$, it suffices to show that $K_{X}$ is a subgroupoid of $\mathrm{F}_{\mathrm{X}}$. However, this is an easy consequence of 2.4 and 2.5.
2.7. Lemma. Let $u=\sum_{i=1}^{n} \alpha^{n_{i}} \beta^{n_{i}} x_{i} \in K_{X}$ and $u \in X$. Then $n_{i}+n_{i}>0$ for every $1 \leq i \leq r$.

Proof. Suppose, on the contrary, that $n_{j}=n_{j}=0$ for soae $1 \leqslant j \leqslant r$. Since $u \in X$, we have $r \geq 2$. Let $1 \leqslant p \leqslant r$. Then $\left({ }_{n_{p}}^{n_{p}+n_{p}}\right) \geq c\left(n_{p}+n_{p}, n_{p}, u\right) \geq\left({ }_{n_{p}+n_{p}-n_{p}-n_{p}}^{n_{p}-n_{p}}\right)+\left({ }_{p}^{n_{p}+n_{p}-n_{j}-n_{j}} \underset{n_{p}-n_{j}}{ }\right)=1+$ $+\left({ }_{n_{p}}{ }_{n_{p}} \mathbf{p}_{p}\right.$, since $u \in K_{X}$, a contradiction.
2.8. Leman. $K_{X} \subseteq G_{x}$

Proof. Consider an element $u=\sum_{i=1}^{n} \alpha^{n_{i}} \beta^{n_{i}} x_{i}$ from $K_{X}$. For every $0 \leqslant n \leqslant \sigma^{\prime}(u)$ and every integer $k$, we shall construct by induction on $n$ two eta $4_{x}^{n}$ and $\mathrm{B}_{\mathrm{k}}^{\mathrm{n}}$ having the following
(1) $A_{k}^{n} \cap B_{k}^{n}=\varnothing$.
(2) Card $\left(A_{k}^{n}\right)=\left(\frac{n}{k}\right)-c(n, k, u)$.
(3) Card $\left(B_{k}^{n}\right)=\operatorname{Card}\left\{i ; n_{i}=k, m_{i}=n-k\right\}$.
(4) If $0 \leq k \leq n$ then $A_{k}^{n}$ and $B_{k}^{n}$ are subsets of $E_{k, n-k}$.

First, let $n=0=k$. If $u \in X$, then put $A_{0}^{0}=\varnothing$ and $B=$ $=\{\varnothing\}$. If $u \notin x$, then put $A_{0}^{0}=\{0\}$ and $B_{0}^{0}=\varnothing$. Purther, let either $k<0$ or $k>n$. Then we put $A_{k}^{n}=B_{k}^{n}=\varnothing$. Finally, let $n>0$ and $0 \leq k \leq n$. Denote by $I$ the set of all $a_{1} \ldots a_{n} \in E_{k, n-k}$ such that either $a_{n}=\propto$ and $a_{1} \ldots a_{n-1} \in \mathbb{A}_{k-1}^{n-1}$ or $a_{n}=\beta$ and $a_{1} \ldots a_{n-1} \in A_{k}^{n-1}$. By the induction hypothesis, Card $(I)=$ $=\operatorname{Card}\left(A_{k-1}^{n-1}\right)+\operatorname{Card}\left(A_{k}^{n-1}\right)=\binom{n-1}{k-1}-c(n-1, k-1, u)+\binom{n-1}{k}-$
 $-c(n, k, u)+\operatorname{Card}\left\{i ; n_{i}=k, m_{i}=n-k\right\}$. Since $\left(\frac{1}{k}\right) \geq c(n, k, u)$, the set $I$ can be divided into two disjoint sets $A$ and $B$ of cardinalities $\binom{n}{k}-c(n, k, u)$ and $\operatorname{Card}\left\{i ; n_{i}=k, m_{i}=n-k\right\}$, resp. Now, it suffices to put $A_{k}^{n}=A$ and $B_{k}^{n}=B$.

Denote by $C$ the union of all the sete $A_{k}^{n}$ and $B_{k}^{n}$. Moreover, let $D$ designate the union of all the sets $B_{k}^{n}$ and let $D_{0}$ be the set of all $a_{1} \ldots a_{n} \in C$ such that $a_{1} \ldots a_{n} \propto \& C$. It is easy to see that $D \subseteq D_{0}$. As for the converse inclusion, let $a=a_{1} \ldots a_{n} \in D_{0}$. We have $a \in F_{k, n-k}$ for sone $0 \leq k \leq n$. If $a<$ $<\sigma^{\sim}(u)$ then $a \in \mathbb{A}_{k}^{n}$, and therefore $a \in B_{k}^{n} \subseteq D$. If $n=\sigma^{\sim}(u)$ then $u \in K_{X}$ yields Card $\left(A_{k}^{n}\right)=\binom{n}{k}-c(n, k, u)=0, A_{k}^{n}=\emptyset$ and $\star \in B_{k}^{n} \subseteq D$. We have proved that $D=D_{0}$. Further, it is easy to verify that the set $C$ satisfies the conditions (1), (2) and (3) of 1.1. Moreover, Card ( $D$ ) $=r$ and there exists a bijective mapping $g$ of $D$ onto $\{1, \ldots, r\}$ such that if $e \in B_{k}^{n}$ and
term $t$ over $X$ such that $C=I(t)$ and $t_{[e]}=x_{g(e)}$ for every $e \in D$. According to $2.2, h(t)=u$ where $h$ is the homomorphism of $W_{X}$ onto $G_{X}$ extending id ${ }_{X}$, and so $u \in G_{X}$.

Theorem 2.1 follows now imnediately from 2.3, 2.6 and 2.8 .
2.9. Lemma. Let $u \in P_{X}, x, y, z \in X$ and $c, d \geq 0$. Then $u+\alpha^{c} \beta^{d} x \in H_{X}$ iff $u+\alpha_{n_{1}}^{c+1} \beta^{d} y+\alpha^{c} \beta^{d+1} z \in E_{X}$.

Proof. Let $u=\sum_{i=1}^{n} \alpha^{n_{i}} \beta^{m_{i}} x_{i}$ and $n=\max \left(\sigma^{( }(u), c+d+1\right)$. By 2.4, $u+\alpha^{c} \beta^{d} x \in H_{k}$ iff $\binom{n}{k}=c(n, k, u)+\binom{n-c-d}{k-c}$ for all k. Similarly, $u+\alpha^{c+1} \beta^{d} y+\alpha^{c} \beta^{d+1} z$ belongs to $H_{X}$ iff $\binom{n}{k}=c(n, k, u)+\binom{n-c-d-1}{k-c-1}+\binom{n-c-d-1}{k-c}$ for every $k$. The rest is clear.
2.10. Lemma. Let $u=\sum_{i=1}^{n} \alpha^{n_{i}} \beta^{m_{i}} x_{i} \quad H_{X}$ and $n=\sigma(u)$. Then $r \leqslant 2^{n}$. Moreover, $r=2^{n}$ iff $n_{i}+n_{i}=n$ for every $i \leqslant i \leqslant r$. In this case, $\binom{n}{k}=$ Card $\left\{i ; n_{i}=k\right\}$ for every $k$.

Proof. Easy.
2.11. Lemma. Let $u=\sum_{i=1}^{\mu} \alpha^{n_{i}} \beta^{m_{i}} x_{i} \in H_{x}$ and $n=\sigma^{\sim}(u)$. Suppose that $r=2^{n}$. Then $u \in G_{x}$.

Proof. By 2.10, $n=n_{i}+n_{i}$ for all $i$ and $\binom{n}{k}=\operatorname{Card}\{i ;$ $\left.n_{i}=k\right\}$ for every $k$. However, for each $0 \leqslant k \leqslant n$, we have $\left(\frac{n}{k}\right)=$ $=$ Card ( $\mathbf{F}_{\mathbf{k}, \mathrm{n}-\mathbf{k}}$ ), and 80 there exists a bijective mapping $\mathbf{f}_{\mathbf{k}}$ of $\mathbf{k}_{k, n-k}$ onto $\left\{i ; n_{i}=k\right\}$. Put $f=f_{0} \cup \ldots \cup f_{n}$, so that $f$ is a bijective mapping of $\mathrm{F}_{\mathrm{n}}$ onto $\{1, \ldots, r\}$. Clearly, there exists unique $t \in W_{X}$ such that $I(t)=K_{0} \cup \ldots \cup K_{n}$ and $t_{[e]}=x_{f}(e)$ for every $\in \in \mathrm{K}_{\mathrm{h}}$. By $2.2, \mathrm{~h}(\mathrm{t})=\mathrm{u}$, and hence $u \in G_{\mathrm{X}}$.
2.12. Remark. As it is proved in [3], every medial cancellation groupoid can be imbedded into a medial quasigroup. Using this and some results from [1], it is possible to prove

## 2.3 directly and without an application of the equational

 theory of entropic groupoids.
## 3. A construction of free commutative medial groupoids.

Let $X$ be a non-empty set. Denote by $\mathrm{CF}_{\mathrm{X}}^{\prime}$ the free algebra over $X$ in the variety of algebras of the type $\{+, 0, \propto\}$ satisfying the identities $(x+y)+z=x+(y+z), x+y=y+x, x+$ $+0=x, \alpha(x+y)=\alpha x+\alpha y, \propto 0=0$. Further, define $a$ multiplication on $C F_{X}^{\dot{X}}$ by $u \boldsymbol{v}=\propto u+\propto v$. We obtain thus a groupoid $C F_{X}$. Let $C G_{X}$ be the subgroupoid of $C F_{X}$ generated by $X$. Finally, for $u=\sum_{i=1}^{n} \alpha^{n_{i}} x_{i} \in C F_{y}$, define $\sigma(u)=\max \left(n_{i} ; 1 \leq\right.$ $\leq i \leq r)$.
3.1. Theorem. Let $X$ be a non-empty set. Then the groupoid $C_{X}$ is the free commutative medial groupoid over $X$. An element $u=\sum_{i=1}^{\mu} \alpha^{n_{i}} x_{i}$ of $C F_{x}$ belongs to $C G_{x}$ iff $\sum_{k=0}^{\infty} 2^{-k}$ Card $\{i ;$ $\left.n_{i}=k\right\}=1$.

The proof of this theoren will be divided into seven lemmas.
3.2. Lemma. Let $h$ be the unique homomorphism of $W_{X}$ onto $C G_{X}$ such that $h(x)=x$ for every $x \in X$. If $t \in W_{X}$ then $h(t)=\sum_{e \in I^{*}(t)} \alpha^{\delta(e)} t_{[e]}$. If $u, v \in W_{X}$ then $h(u)=h(v)$ iff $P_{n}(x, u)=P_{n}(x, v)$ for all $x \in X$ and $n \geq 0$.

Proof. Easy.
3.3. Lemma. $C G_{X}$ is a free commutative medial groupoid over X .

Proof. Use 3.2 and 1.3.
3.4. Lemma. Denote by $L_{x}$ the set of all $u=\sum_{i=1}^{n} \alpha^{n_{i}} x_{i} \in$ $\in C F_{X}$ such that $\sum_{k=0} 2^{-k}$ Card $\left\{i ; \Omega_{i}=k\right\}=1$. Let $v \in \mathcal{C}_{X}$,
$x, y, z \in X$ and $n \geq 0$. Then $V+\alpha^{n} x \in L_{x}$ iff $\nabla+\alpha^{n+1} y+$ $+\alpha^{n+1} z \in L_{X}$.

Proof. Easy.
3.5. Lemma. $c_{x} \subseteq I_{x}$.

Proof. It is easy to check that $I_{X}$ is a subgroupoid of ${ }^{C F} X$
3.6. Lemma. Let $u=\sum_{i=1}^{n} \alpha^{n_{i}} x_{i} \in L_{X}$ and $r=1$. Then $u \in X$ and $n_{i}=0$.

Proof. Obvious.
3.7. Lemma. Let $u=\sum_{i=1}^{r} \alpha^{n_{i}} x_{i} \in L_{X}$ and $r \geqslant 2$. Then Card $\left\{\mathbf{i} ; n_{i}=\sigma^{\prime}(u)\right\} \geq 2$.

Proof. Easy.
3.8. Lemma. $\mathrm{L}_{\mathrm{x}} \subseteq C G_{\mathrm{x}}$.

Proof. Consider an element $u=\sum_{i=1}^{\mu} \alpha^{n_{i}}{x_{i}}^{\epsilon} L_{X}$. We are going to show by induction on $r$ that $u \in C G_{X}$. According to 3.6, we can assume that. $r \geq 2$. Put $n=\sigma^{\sim}(u)$. By 3.7 , there are two different numbers $1 \leq c, d \leq r$ with $n_{c}=n_{d}=n$. Let $v=$ $=\sum_{i \neq c, d} \alpha^{n_{i}} x_{i}+\alpha^{n-1} x_{c}$. It is easy to see that $v \in L_{x}$. Hence by the induction hypothesis $v \in C G_{X}$. Further, we have $v=h(t)$. for some $t \in W_{X}$. By 3.2 , there is an $e \in I_{n-1}(t)$ with $t_{[e]}=x_{c}$. How, it is easy to show that $h(w)=u$ for sone $w \in \mathbf{W}_{X^{*}}$
