## A NOTE ON LINEAR DIFFERENTIAL EQUATIONS OF THE SECOND ORDER WITH THE SAME BASIC CENTRAL DISPERSION OF THE FIRST KIND

MIROSLAV LAITICH

(Received April 15th, 1980)

Consider a linear differential equation of the 2nd order

$$y'' = q(t) \cdot y, \quad (q)$$

where  $q \in C^{(0)}$  on an interval  $j = (-\infty, \infty)$ . We assume the solution of the differential equation  $(q)$  to be oscillatory on the interval  $j$  to both end points of the interval.

Let  $\varphi$  be the basic (z.) central (c.) dispersion of the 1st kind relative to the differential equation  $(q)$ . Let  $c \in j$  be an arbitrary number and let  $y$  be such a solution of the differential equation  $(q)$  that  $y(c) = 0$ . The zeros of  $y$  are just the numbers  $c_\nu = \varphi_\nu(c)$ ,  $\nu = 0, \pm 1, \pm 2, \dots$

O. Borůvka [1] proved under the above assumptions the following Theorem: The carriers  $\bar{q}$  of all differential equations  $(\bar{q})$  with the same basic central dispersion of the 1st kind  $\varphi$ , possessed by the differential equation  $(q)$  with the carrier  $q$ , are given by the formula

$$\bar{q} = q + \frac{p''}{p} + 2 \frac{y'}{p} \cdot \frac{p'}{y}, \quad (*)$$

where  $p$  is an arbitrary function defined in the interval  $j$  having the following five properties:

- 1°  $p(t) \neq 0$  for  $t \in j$ ,
- 2°  $p[\varphi(t)] = p(t)$  for  $t \in j$ ,
- 3°  $p(t) \in C^{(2)}(j)$ ,
- 4°  $p'(c) = 0$ ,
- 5°  $\int_c^{\varphi(c)} \left[ \frac{1}{p^2(\sigma)} - \frac{1}{p^2(c)} \right] \cdot \frac{d\sigma}{y^2(\sigma)} = 0$

and the value of the last addend on the right in  $(*)$  at the point  $c_\nu$  is defined by the formula  $2p''(c_\nu)/p(c_\nu)$ .

We present now some findings on the function  $p$  discussed in the above theorem.

**Theorem 1.**

Let  $c \in j$  be an arbitrary number and let  $f(t)$  be an increasing 1st phase of the differential equation (q),  $f(c) = 0$ . Let the function  $h = h(t)$  satisfy the following conditions;

$O^\circ$   $h(t)$  is defined on the interval  $j$ ,

$A^\circ$   $h(t + \pi) = h(t)$  for  $t \in j$ ,

$B^\circ$   $h(t) \in C^{(0)}$ ,  $h(t) \cdot \sin^2(t) \in C^{(2)}(j)$ ,

$C^\circ$   $\int_0^\pi h(t) dt = 0$ ,

$D^\circ$   $h(t) \cdot \sin^2(t) < 1$  for  $t \in j$ .

Then the function

$$p(t) = \{1 - \sin^2 [f(t)] \cdot h[f(t)]\}^{-1/2}, \quad t \in j \quad (**)$$

possesses the five properties  $1^\circ - 5^\circ$  stated in the Theorem of Borůvka. And conversely also, if the function  $p = p(t)$  possesses the properties  $1^\circ - 5^\circ$  in  $j$ , then there exists a function  $h = h(t)$  with the properties  $O^\circ - D^\circ$  and there holds the equality

$$p(t) = \{1 - \sin^2 [f(t)] \cdot h[f(t)]\}^{-1/2}, \quad t \in j.$$

Proof. Let us first note that the 1st phase is known that it satisfies the function equation

$$E^0: \quad [f\varphi(t)] - f(t) = \pi \quad \text{for } t \in j,$$

that

$$F^0: \quad f \in C^{(3)},$$

for  $f$  is a solution of the 3rd order nonlinear equation

$$\sqrt{|f'|} \cdot \left( \frac{1}{\sqrt{|f'|}} \right)'' - f'^2 = q, \quad q \in C^{(2)}(j),$$

that by assumption

$$G^0: \quad f(c) = 0,$$

that

$$H_1^0: \quad f(t) \text{ maps the interval } j \text{ schlicht on itself,}$$

that

$$H_2^0: \quad f'(t) \neq 0 \quad \text{for } t \in j.$$

We know also that the solution  $y$  discussed in the Theorem of O. Borůvka may be expressed in the form

$$I_0: \quad y = \sin f(t) / \sqrt{|f'(t)|}.$$

Now we prove

**Property  $1^\circ$ .**

Let  $p = p(t)$  be defined by the equation (\*\*). With respect to  $D^0$  and  $H_2^0$  we infer that  $p = p(t)$  is a real function different from zero in  $j$ .

**Property 2°.**

With respect to  $A^0$  and  $E^0$  we may say that

$$\begin{aligned} p[\varphi(t)] &= \frac{1}{\sqrt{1 - \sin^2 [f(\varphi(t))] \cdot h[f(\varphi(t))]} = \frac{1}{\sqrt{1 - \sin^2 [f(t) + \pi] \cdot h[f(t) + \pi]}} = \\ &= \frac{1}{\sqrt{1 - \sin^2 [f(t)] \cdot h[f(t)]}} = p(t) \quad \text{for } t \in j. \end{aligned}$$

**Property 3°.**

It is easy to see that with respect to  $B^0$  and  $F^0$   $p(t) \in C^{(2)}(j)$ .

**Property 4°.**

Differentiating (\*\*) we obtain

$$\begin{aligned} p'(t) &= \frac{f'(t)}{2\{1 - \sin^2 [f(t)] \cdot h[f(t)]\}^{3/2}} \times \\ &\times [2 \sin [f(t)] \cdot \cos [f(t)] \cdot h[f(t)] + \sin^2 [f(t)] \cdot h'[f(t)]]. \end{aligned}$$

With respect to  $G_0$  we get  $p'(c) = 0$  for the square bracket is equal to zero at the point  $t = c$ .

**Property 5°.**

By calculation we find that with respect to (\*\*),  $H_2^0$ ,  $E^0$  and  $C^0$  is

$$\begin{aligned} \int_c^{\varphi(c)} \left[ \frac{1}{p^2(\sigma)} - \frac{1}{p^2(c)} \right] \frac{d\sigma}{y^2(\sigma)} &= \int_c^{\varphi(c)} [1 - \sin^2 [f(\sigma)] \cdot h[f(\sigma)] - 1] \cdot \frac{f'(\sigma)}{\sin^2 [f(\sigma)]} \cdot d\sigma = \\ &= - \int_c^{\varphi(c)} h[f(\sigma)] \cdot f'(\sigma) \cdot d\sigma = - \int_0^\pi h(\tau) \cdot d\tau = 0, \quad \text{for } p(c) = 1. \end{aligned}$$

Conversely, let the function  $p = p(t)$  have the properties 1°–5°. Clearly, without any loss on generality, we may assume that  $p^2(c) = 1$  and so  $p^2(t) > 0$  on  $j$  with respect to 1°. According to 2° we have  $f[\varphi(t)] = f(t) + \pi$  and since  $f(c) = 0$ , it follows that  $f^{-1}(t + \pi) = \varphi[f^{-1}(t)]$ ,  $f^{-1}(c) = 0$ .

We prove now Property 0°. Let us define the function  $h(t)$  on the interval  $j$  by putting

$$\begin{aligned} h(t) &= \begin{cases} \frac{1}{\sin^2 t} \cdot \left( 1 - \frac{1}{p^2[f^{-1}(t)]} \right) & \text{for } t \in j, t \neq k\pi, \\ \frac{p''(c) \cdot f^{-1'2}(c)}{p^3(c)} & \text{for } t = k\pi \\ k = 0, \pm 1, \pm 2, \dots \end{cases} \end{aligned}$$

Since

$$\begin{aligned}\lim_{t \rightarrow 0} h(t) &= \lim_{t \rightarrow 0} \frac{2p'[f^{-1}(t)] \cdot f^{-1'}(t)}{2 \sin t \cdot \cos t \cdot p^3[f^{-1}(t)]} = \frac{f^{-1'}(0)}{p^3(c)} \cdot \lim_{t \rightarrow 0} \frac{p'[f^{-1}(t)]}{\sin t} = \\ &= \frac{f^{-1'}(0)}{p^3(c)} \cdot \lim_{t \rightarrow 0} \frac{p''[f^{-1}(t)] \cdot f^{-1'}(t)}{\cos t} = \frac{p''(c) \cdot f^{-1'2}(c)}{p^3(c)}\end{aligned}$$

and since

$$\begin{aligned}h(t + \pi) &= \frac{1}{\sin^2(t + \pi)} \cdot \left(1 - \frac{1}{p^2[f^{-1}(t + \pi)]}\right) = \\ &= \frac{1}{\sin^2 t} \left(1 - \frac{1}{p^2[\varphi(f^{-1}(t))]} \right) = \frac{1}{\sin^2 t} \left(1 - \frac{1}{p^2[f^{-1}(t)]}\right) = h(t)\end{aligned}$$

for  $t \neq k\pi$ , is  $h \in C^0(j)$ , which proves the first property in  $B^0$  and  $h(t + \pi) = h(t)$  for  $t \in j$ , which proves the property  $A^0$ .

The function  $h(t) \cdot \sin^2 t = \left(1 - \frac{1}{p^2[f^{-1}(t)]}\right)$  for  $t \in j$  and so  $h(t) \cdot \sin^2 t \in C^{(2)}(j)$ , which proves the second property in  $B^0$  and  $1 - h(t) \cdot \sin^2 t > 0$  for  $t \in j$ , which proves the property  $D^0$ .

Finally, we verify the property  $C^0$ :

$$\begin{aligned}\int_0^\pi h(t) dt &= \int_0^\pi \left(1 - \frac{1}{p^2[f^{-1}(t)]}\right) \cdot \frac{1}{\sin^2 t} dt = \\ &= \int_{f^{-1}(0)}^{f^{-1}(\pi)} \left(1 - \frac{1}{p^2(s)}\right) \cdot \frac{f'(s)}{\sin^2 f(s)} ds = \\ &= \int_0^{\varphi(c)} \left(1 - \frac{1}{p^2(s)}\right) \cdot \frac{f'(s)}{\sin^2 f(s)} ds = 0, \quad \text{for } y = \frac{\sin f(t)}{\sqrt{f'(t)}}\end{aligned}$$

is a solution discussed in the Theorem of O. Borůvka.

With the aid of Theorem 1 and the Theorem of O. Borůvka we can prove the following statement.

**Theorem 2.**

The coefficients  $\bar{q}$  of all differential equations ( $\bar{q}$ ) possessing the basic central dispersion of the 1st kind  $\varphi = t + \pi$  may be expressed in the form

$$\begin{aligned}\bar{q} &= -1 + \frac{3}{4} \frac{[2 \sin(t - c) \cdot \cos(t - c) \cdot h(t - c) + \sin^2(t - c) \cdot h'(t - c)]^2}{[1 - \sin^2(t - c) \cdot h(t - c)]^2} + \\ &\quad \frac{[6 \cos^2(t - c) - 2 \sin^2(t - c)] \cdot h(t - c) +}{+ \frac{1}{2} \frac{+ 6 \sin(t - c) \cos(t - c) \cdot h'(t - c) + \sin^2(t - c) \cdot h''(t - c)}{1 - \sin^2(t - c) \cdot h(t - c)}},\end{aligned}$$

where the function  $h(t)$  satisfies the conditions  $0^0 - D^0$  of Theorem 1.

**Proof.** Putting  $y = \sin(t - c)$ , then  $y' = \cos(t - c)$ . With respect to (\*) we get then

$$\begin{aligned}
 p &= [1 - \sin^2(t - c) \cdot h(t - c)]^{-1/2} \\
 p' &= \frac{1}{2} [1 - \sin^2(t - c) \cdot h(t - c)]^{-3/2} \times \\
 &\quad \times [2 \sin(t - c) \cdot \cos(t - c) \cdot h(t - c) + \sin^2(t - c) \cdot h'(t - c)], \\
 p'' &= \frac{3}{4} [1 - \sin^2(t - c) \cdot h(t - c)]^{-5/2} \times \\
 &\quad \times [2 \sin(t - c) \cdot \cos(t - c) \cdot h(t - c) + \sin^2(t - c) \cdot h'(t - c)]^2 + \\
 &\quad + \frac{1}{2} [1 - \sin^2(t - c) \cdot h(t - c)]^{-3/2} \times \\
 &\quad \times [2 \cos^2(t - c) \cdot h(t - c) - 2 \sin^2(t - c) \cdot h(t - c) + \\
 &\quad + 2 \sin(t - c) \cos(t - c) \cdot h'(t - c) + 2 \sin(t - c) \cdot \cos(t - c) \cdot h'(t - c) + \\
 &\quad + \sin^2(t - c) \cdot h''(t - c)].
 \end{aligned}$$

Therefore

$$\begin{aligned}
 p''/p &= \frac{3}{4} [2 \sin(t - c) \cdot \cos(t - c) \cdot h(t - c) + \sin^2(t - c) \cdot h'(t - c)]^2 \times \\
 &\quad \times [1 - \sin^2(t - c) \cdot h(t - c)]^{-2} + \frac{1}{2} [2 \cos^2(t - c) \cdot h(t - c) - \\
 &\quad - 2 \sin^2(t - c) \cdot h(t - c) + 4 \sin(t - c) \cos(t - c) \cdot h'(t - c) + \\
 &\quad + \sin^2(t - c) \cdot h''(t - c)] [1 - \sin^2(t - c) \cdot h(t - c)]^{-1}, \\
 p'/p &= \frac{1}{2} [2 \sin(t - c) \cdot \cos(t - c) \cdot h(t - c) + \sin^2(t - c) \cdot h'(t - c)] \times \\
 &\quad \times [1 - \sin^2(t - c) \cdot h(t - c)]^{-1}.
 \end{aligned}$$

Next we have

$$\begin{aligned}
 2 \cdot \frac{y'}{p} \cdot \frac{p'}{y} &= \frac{\cos(t - c) \cdot [2 \cos(t - c) \cdot h(t - c) + \sin(t - c) \cdot h'(t - c)]}{[1 - \sin^2(t - c) \cdot h(t - c)]}, \\
 \frac{p''}{p} + 2 \cdot \frac{y'}{p} \cdot \frac{p'}{y} &= \\
 &= \frac{3}{4} \cdot \frac{[2 \sin(t - c) \cdot \cos(t - c) \cdot h(t - c) + \sin^2(t - c) \cdot h'(t - c)]^2}{[1 - \sin^2(t - c) \cdot h(t - c)]^2} + \\
 &\quad + \frac{1}{2} \cdot \frac{[6 \cos^2(t - c) \cdot h(t - c) - 2 \sin^2(t - c) \cdot h(t - c) + \\
 &\quad + 6 \sin(t - c) \cdot \cos(t - c) \cdot h'(t - c) + \sin^2(t - c) \cdot h''(t - c)]}{[1 - \sin^2(t - c) \cdot h(t - c)]}
 \end{aligned}$$

whence the statement follows, because  $q = -1$ .

SOUHRN

## PŘÍSPĚVEK K LINEÁRNÍM DIFERENCIÁLNÍM ROVNICÍM 2. ŘÁDU S TOUŽ ZÁKLADNÍ CENTRÁLNÍ DISPERSÍ 1. DRUHU

MIROSLAV LAITOX

Uvažujeme lineární diferenciální rovnici 2. řádu  $(q) : y'' = q(t) \cdot y$  se spojitým koeficientem  $q$  a s oscilujícími řešeními v intervalu  $j = (-\infty, \infty)$  a k diferenciální rovnici  $(q)$  příslušnou základní centrální dispersí 1. druhu  $\varphi$ . O. Borůvka v [1] dokázal, že nosiče  $(\bar{q})$  všech diferenciálních rovnic  $y'' = \bar{q}(t) \cdot y$  s touž základní centrální dispersí 1. druhu  $\varphi$  jsou dány vzorcem

$$\bar{q} = q + \frac{p''}{p} + 2 \frac{y'}{p} \cdot \frac{p'}{y},$$

kde  $y$  je řešení diferenciální rovnice  $(q)$  a funkce  $p$  je charakterizována jistými pěti vlastnostmi.

V článku je konstruována funkce  $p$  pomocí periodické funkce  $h = h(t)$ , pro niž jsou nalezeny nutné a postačující podmínky.

РЕЗЮМЕ

## ЗАМЕЧАНИЕ К ЛИНЕЙНЫМ ДИФФЕРЕНЦИАЛЬНЫМ УРАВНЕНИЯМ 2-го ПОРЯДКА С ОДИНАКОВОЙ ЦЕНТРАЛЬНОЙ ДИСПЕРСИЕЙ 1-го РОДА

МИРОСЛАВ ЛАЙТОХ

Рассматривается дифференциальное уравнение 2-го порядка  $(q) : y'' = \bar{q}(t) y$  с непрерывным коэффициентом  $q$  и с осцилирующими решениями в интервале  $j = (-\infty, \infty)$  и соответствующая основная центральная дисперсия 1-го рода  $\varphi$ . О. Боровка в [1] доказал, что носители  $(\bar{q})$  всех дифференциальных уравнений  $y'' = \bar{q}(t) \cdot y$  с одинаковой центральной дисперсией 1-го рода  $\varphi$  определены выражением

$$\bar{q} = q + \frac{p''}{p} + 2 \frac{y'}{p} \cdot \frac{p'}{y},$$

где  $u$  является решением дифференциального уравнения  $(q)$  и функция  $p$  характеризуется определенными пятью свойствами.

В настоящей работе конструируется функция  $p$  с помощью периодической функцией  $h = h(t)$  для которой найдены необходимые и достаточные условия.
