NATURAL DIFFERENTIAL OPERATORS
BETWEEN SOME NATURAL BUNDLES

W. M. Mikulski, Kraków

(Received August 8, 1991)

Summary. Let $F$ and $G$ be two natural bundles over $n$-manifolds. We prove that if $F$ is of type (I) and $G$ is of type (II), then any natural differential operator of $F$ into $G$ is of order 0. We give examples of natural bundles of type (I) or of type (II). As an application of the main theorem we determine all natural differential operators between some natural bundles.

Keywords: Natural bundles, natural differential operators

AMS classification: 58A20, 53A55

1. NATURAL BUNDLES AND BUNDLE FUNCTORS

Throughout the paper all manifolds are assumed to be paracompact, without boundary, second countable, finite dimensional and smooth, i.e. of class $C^\infty$. Maps will be assumed to be $C^\infty$.

Let $M^f_n$ be the category of all $n$-dimensional manifolds and their embeddings, $FM^f_n$ the category of all fibered manifolds over $n$-manifolds and their morphisms, and let $B: FM^f_n \to M^f_n$ be the base functor. Given a functor $F: M^f_n \to FM^f_n$ satisfying $B \circ F = \text{id}_{M^f_n}$, we denote by $p^F_M: FM \to M$ its value on an $n$-manifold $M$ and by $F_x f: F_x M \to F_{f(x)} N$ the restriction of its value $F f: FM \to FN$ for $f: M \to N$ to the fibres of $FM$ over $x$ and of $FN$ over $f(x)$, $x \in M$.

The concept of a natural bundle over $n$-manifolds was introduced by A. Nijenhuis ([11]) as a modern approach to the classical theory of geometric objects. Using the results of D. B. A. Epstein and W. P. Thurston ([3]) we can formulate the definition of natural bundles as follows.
Definition 1.1. A natural bundle over n-manifolds is a functor \( F: MF_n \rightarrow FMf_n \) satisfying \( B \circ F = \text{id}_{MF_n} \) and the localization condition: if \( i: U \rightarrow M \) is the inclusion of an open subset, then \( F_i: FU \rightarrow (p^F_M)^{-1}(U) \) is a diffeomorphism.

If we replace (in Definition 1.1) \( MF_n \) by the category \( Mf \) of all manifolds and all maps and \( FMf_n \) by the category \( FMf \) of all fibered manifolds and their morphisms we obtain the concept of bundle functors, [7]. The Weil functors \( TA \) of \( A \) velocities ([10]) and the functors \( T^{(r)} \) of linear higher order tangent bundles ([6]) are examples of bundle functors. Of course, the restriction of a bundle functor to \( MF_n \) is a natural bundle. The classification of natural bundles can be obtained by the Palais-Terng theorem [12], see [5].

We say that a natural bundle (a bundle functor) \( F \) is linear if \( F: MF_n \rightarrow VMf_n \) \((F: Mf \rightarrow VMf)\), where \( VMf_n \) \((VMf)\) is the category of all vector bundles over \( n \)-manifolds (of all vector bundles, respectively) and their vector bundle morphisms.

Let \( M, N, P \) be manifolds. A parametrized system of smooth maps \( f_p: M \rightarrow N, p \in P \) is said to be smoothly parametrized, if the resulting map \( f: M \times P \rightarrow N \) is of class \( C^\infty \).

Proposition 1.1 ([3], [8]). Every natural bundle \( F: MF_n \rightarrow FMf_n \) (every bundle functor \( F: Mf \rightarrow FMf \)) satisfies the regularity condition: if \( f: M \times P \rightarrow N \) is a smoothly parametrized family of embeddings (of maps, respectively), then the family \( \vec{F}f: FM \times P \rightarrow FN \) defined by \((\vec{F}f)_p = F(f_p)\) is also smoothly parametrized.

2. Natural differential operators

Let \( F, G: MF_n \rightarrow FMf_n \) be two natural bundles. Given a manifold \( M \in MF_n \) we denote by \( \Gamma FM \) the set of all locally defined smooth sections of the bundle \( FM \rightarrow M \). Suppose that we have a family \( D \) of functions \( D_M: \Gamma FM \rightarrow \Gamma GM, M \in MF_n \) such that \( \text{Dom}(D_M(\sigma)) = \text{Dom}(\sigma) \) for any \( \sigma \in \Gamma FM \).

Definition 2.1 ([14]). A family \( D \) as above is called a natural differential operator of \( F \) into \( G \) if the following naturality condition is satisfied: for any \( M \in MF_n \), any \( \sigma \in \Gamma FM \) and any embedding \( \varphi: M \rightarrow N \) of two \( n \)-manifolds we have \( D_N(\varphi^*_N \sigma) = \varphi^*_G D_M(\sigma) \), where \( \varphi^*_N: \Gamma FM \rightarrow \Gamma FN \) is defined by \( \varphi^*_N \sigma = F \varphi \circ \sigma \circ \varphi^{-1} \).

Definition 2.2. Let \( r \geq 0 \) be an integer or infinity. Let \( D \) be a natural differential operator of \( F \) into \( G \). We say that \( D \) is of order \( r \) if for any \( M \in MF_n \), any \( x \in M \) and any two sections \( \sigma_1, \sigma_2 \in \Gamma FM \) defined on some open neighbourhoods of \( x \) the condition \( j^*_x \sigma_1 = j^*_x \sigma_2 \) implies \( D_M(\sigma_1)(x) = D_M(\sigma_2)(x) \), and \( r \) is the smallest number with the above property.
J. Slovák has proved that every natural differential operator has locally finite order, [13]. In particular, every natural differential operator is of order \( \leq \infty \).

In [2], D. B. A. Epstein has constructed such natural differential operator \( D \) of \( F \) into \( G \) and such sections \( \sigma_n, \sigma \in \Gamma FR^2, n = 1, 2, \ldots \), that \( j_0^\infty \sigma_n \to j_0^\infty \sigma \) and \( D_{\mathbb{R}^2}(\sigma_n)(0) \to D_{\mathbb{R}^2}(\sigma)(0) \) as \( n \to \infty \). Therefore the following proposition is interesting.

**Proposition 2.1** ([9]). Let \( D \) be a natural differential operator of \( F \) into \( G \), where \( F, G \) are natural bundles over \( n \)-manifolds. Suppose that \( \sigma_m, \sigma \in \Gamma FM, m = 1, 2, \ldots \) are local sections defined on some open neighbourhoods of \( x \in M \) such that \( j_x^\infty \sigma_m \to j_x^\infty \sigma \) as \( m \to \infty \). Suppose also that there exists a vector field \( X \) on \( M \) such that \( X(x) \neq 0 \) and \( j_x^\infty (L_X \sigma) = j_x^\infty (0) \), where \( L_X \sigma \) is the Lie derivative of \( \sigma \) with respect to \( X \). Then \( D_M(\sigma_m)(x) \to D_M(\sigma)(x) \) as \( m \to \infty \).

**Remark.** \( L_X \sigma : \text{Dom}(\sigma) \to TF M \) is defined as follows. For any \( y \in \text{Dom}(\sigma) \), \( (L_X \sigma)(y) \) is the vector from \( T_{\sigma(y)}FM \) given by a curve \( t \to (\varphi_t)^\mathbb{R} \sigma(y) \), where \( \{\varphi_t\} \) is a local flow of \( X \) near \( y \).

3. NATURAL BUNDLES OF TYPE (I)

**Definition 3.1.** Let \( F : Mf_n \to FMf_n \) be a natural bundle. A section \( \sigma_o \in \Gamma FR^n \) is invariant with respect to the translations iff \( (\tau_x)^\mathbb{R} \sigma_o = \sigma_o \) for any \( x \in \mathbb{R}^n \), where \( \tau_x : \mathbb{R}^n \to \mathbb{R}^n \) is the translation by \( x \). We say that \( F \) is of type (I) iff for any \( \sigma \in \Gamma FR^n \) defined on an open neighbourhood of \( 0 \in \mathbb{R}^n \) there exists \( \sigma_o \in \Gamma FR^n \) invariant with respect to the translations such that \( j_0^\infty ((t \text{id})^\mathbb{R} \sigma) \to j_0^\infty (\sigma_0) \) as \( t \to \infty \), where \( \text{id} : \mathbb{R}^n \to \mathbb{R}^n \) is the identity map.

In this section we give some examples of natural bundles of type (I). We start with the following proposition.

**Proposition 3.1.** Let \( F : Mf_n \to FMf_n \) be a natural bundle. Suppose that for every \( v \in F_0\mathbb{R}^n \) there exists a chart \( (V, \varphi) \) on \( F_0\mathbb{R}^n \) defined on an open neighbourhood of \( v \) onto an open neighbourhood of \( 0 \in \mathbb{R}^k \) such that

1. \( F_0(t \text{id})(V) \subseteq V \) for all sufficiently large \( t \in \mathbb{R} \),
2. \( \varphi \circ F_0(t \text{id}) \circ \varphi^{-1} \) is linear on \( \varphi(V) \) for all sufficiently large \( t \), and
3. for every \( w \in V \) there exists \( \lim_{t \to \infty} F_0(t \text{id})(w) \in V \).

Then \( F \) is of type (I).

**Proof.** Let us consider a section \( \sigma \in \Gamma FR^n \) defined on an open neighbourhood of \( 0 \in \mathbb{R}^n \). We can assume that \( F_0\mathbb{R}^n \) is an open neighbourhood of \( 0 \in \mathbb{R}^k \) and
that $F_0(t\text{id})$ is linear for sufficiently large $t$. Moreover, we can assume that for every $w \in F_0\mathbb{R}^n$ there exists $\lim_{t \to \infty} F_0(t\text{id})(w)$. Using the trivialization $\mathbb{R}^n \times F_0\mathbb{R}^n \ni (x, v) \to F\tau(v) \in FR^n$ we identify $\sigma$ with the map $\sigma: \text{Dom}(\sigma) \to F_0\mathbb{R}^n$. Then $(t\text{id})^F\sigma$ is identified with $F_0(t\text{id}) \circ \sigma \circ (\frac{1}{t}\text{id})$. It is easy to see that $j_0^\infty (F_0(t\text{id}) \circ \sigma \circ (\frac{1}{t}\text{id}))$ tends to $j_0^\infty (x \to v_0)$ as $t \to \infty$, where $v_0 = \lim_{t \to \infty} F_0(t\text{id})(\sigma(0))$. Therefore $j_0 ((t\text{id})^F\sigma) \to j_0\sigma$ as $t \to \infty$, where $\sigma \in \Gamma FR^n$ is defined by $\sigma(0) = F\tau(v_0)$.

We have the following obvious corollaries of Proposition 3.1.

**Corollary 3.1.** Let $F: Mf_n \to FMf_n$ be a natural bundle such that for every $t \in \mathbb{R} \setminus \{0\}$, $F_0(t\text{id})$ is the identity map. Then $F$ is of type $(I)$.

**Corollary 3.2.** Let $F: Mf_n \to FMf_n$ be a natural bundle. Suppose that there exists a diffeomorphism $\varphi: F_0\mathbb{R}^n \to \mathbb{R}^k$ such that $\varphi \circ F_0(t\text{id}) \circ \varphi^{-1}$ is linear for all $t \in \mathbb{R} \setminus \{0\}$. Then $F$ is of type $(I)$ if and only if for every $v \in F_0\mathbb{R}^n$ there exists $\lim_{t \to \infty} F(t\text{id})(v)$.

**Corollary 3.3.** Let $F: Mf_n \to VMf_n$ be a linear natural bundle. Then $F$ is of type $(I)$ if and only if for any $v \in F_0\mathbb{R}^n$ there exists $\lim_{t \to \infty} F(t\text{id})(v)$.

**Example 3.1 (Grassmann natural bundles).** Let $k \geq 1$ be an integer such that $k \leq n$. From Corollary 3.1 it follows that the Grassmann natural bundle $G_k$ of $k$-planes tangent to $n$-manifolds ([4]) is of type $(I)$.

**Example 3.2 (natural bundles of connections of higher order).** Let $r \geq 1$ be an integer. By Corollary 3.2, the natural bundle $C_r$ of connections of order $r$ on $n$-manifolds ([14]) is of type $(I)$.

**Example 3.3 (natural bundles of symmetric and antisymmetric covariant tensor fields).** Let $p \geq 0$ be an integer. Using Corollary 3.3 we see that the natural bundle $\Lambda^pT^* (S^pT^*)$ of $p$ times covariant antisymmetric (symmetric, respectively) tensor fields is of type $(I)$.

**Example 3.4 (natural bundles of tensor fields).** Let $p, q \geq 0$ be two integers. It follows from Corollary 3.3 that the natural bundle $T^{(p,q)}$ of $q$ times covariant and $p$ times contravariant tensor fields over $n$-manifolds is of type $(I)$ if and only if $q \geq p$.

**Example 3.5 (cotangent bundles of higher order).** Let $r \geq 1$ be an integer. Let $T^*: Mf_n \to VMf_n$ be the linear natural bundle of cotangent bundles of order $r$ defined as follows. Given $M \in Mf_n$, then $T^* M = J^r(M, \mathbb{R})_0$ is the space of $r$-jets with target 0 of maps $M \to \mathbb{R}$. Then $T^* M$ with the source projection is a vector bundle over $M$. Every embedding $\varphi: M \to N$ induces the map $T^* \varphi$: 

156
It is well known that $T(r)|Mf_n$ is dual to $T^{*r}$, where $T(r): Mf 	o VMf$ is the linear bundle functor of tangent bundles of order $r$, [6]. It follows from the following general lemma that $T^{*r}$ is of type (I).

**Lemma 3.1.** Let $E: Mf 	o VMf$ be a linear bundle functor. Suppose that $F: Mf_n 	o VMf_n$ is natural isomorphic to the dual natural bundle $(E|Mf_n)^*$. Then $F$ is of type (I).

**Proof.** One can assume that $F = (E|Mf_n)^*$. Consider an arbitrary $\omega \in F_0\mathbb{R}^n = (E_0\mathbb{R}^n)^*$. It follows from Proposition 1.1 that for every $v \in E_0\mathbb{R}^n$, $F(t\text{id})(\omega)(v) = \omega(E(\frac{1}{t}\text{id})(v)) \to \omega(E(0)(v))$ as $t \to \infty$. Therefore there exists $\lim_{t\to\infty} F(t\text{id})(\omega)$, and we can apply Corollary 3.3.

**Example 3.6** (fiber product of natural bundles of type (I)). Let $E, F: Mf_n \to FMf_n$ be two natural bundles of type (I). It is obvious that the fiber products $E \times F$ of $E$ and $F$ is of type (I).

**Example 3.7** (natural closed subbundles of natural bundles of type (I)). Let $E: Mf_n \to FMf_n$ be a natural bundle of type (I). Let $F: Mf_n \to FMf_n$ be a natural closed subbundle of $E$, i.e. a natural bundle such that $FM$ is a closed subbundle of $EM$ for any $M \in Mf_n$, and $F\varphi = E\varphi|FM$ for any embedding $\varphi: M \to N$. It is easy to see that $F$ is of type (I). For example, the natural bundle $C^r_\varphi$ of torsion free connections of order $r$ on $n$-manifolds ([14]) is a natural closed subbundle of $C_r$. Hence $C^r_\varphi$ is of type (I).

4. **Natural Bundles of Type (II)**

**Definition 4.1.** Let $G: Mf_n \to FMf_n$ be a natural bundle. We say that $G$ is of type (II) iff for every $v \in G_0\mathbb{R}^n$ either $G(t\text{id})(v) = v$ for all $t \in \mathbb{R} \setminus \{0\}$ or $\lim_{t\to\infty} G(t\text{id})(v)$ does not exist.

**Example 4.1** (Grassmann natural bundles). The Grassmann natural bundle $G_k$ of $k$-planes tangent to $n$-manifolds is of type (II).

**Example 4.2** (natural bundles of tensor fields). Let $p, q \geq 0$ be integers. Then $T^{(p,q)}$ described in Example 3.4 is of type (II) iff $p \geq q$.

**Example 4.3** (linear tangent bundles of high order). Let $r \geq 1$ be an integer. Let $T^{(r)}$ be the linear bundle functor of tangent bundles of order $r$, [6]. Then $T^{(r)}|Mf_n$ is of type (II) (see Lemma 4.1).
Example 4.4 (Weil functor). Let $T^A : M_f \to FM_f$ be the Weil functor of $A$ velocities, [10]. Then (by Lemma 4.1) $T^A|M_{f_n}$ is of type (II).

Lemma 4.1. Let $E : M_f \to FM_f$ be a bundle functor. Then $E|M_{f_n}$ is of type (II).

Proof. Let $v \in E_0R^n$ be a point. Suppose that $E(t\text{id})(v) \to v_0$ as $t \to \infty$. In particular, $v_m = E(\text{mid})(v) \to v_0$ as $m \to \infty$. Then it follows from Proposition 1.1 that $v = E(\frac{1}{m}\text{id})(v_m) \to EO(v_0)$ as $m \to \infty$, i.e. $v = EO(v_0)$. Hence $E(t\text{id})(v) = E(t\text{id})EO(v_0) = EO(v_0) = v$ for all $t \in R \setminus \{0\}$.  \\

Example 4.5 (natural subbundles). Let $E : M_{f_n} \to FM_{f_n}$ be a natural bundle of type (II). Let $G : M_{f_n} \to FM_{f_n}$ be a natural subbundle of $E$. Then $G$ is of type (II).

Example 4.6 (natural bundles of non-vanishing tensor fields). Let $p, q \geq 0$ be integers. Then the natural bundle $T^{(p,q)}^n : M_{f_n} \to FM_{f_n}$ of non-vanishing $q$ times covariant and $p$ times contravariant tensor fields is of type (II).

Example 4.7 (natural bundles of Riemannian metrics). The natural bundle $\text{Riem} : M_{f_n} \to FM_{f_n}$ of Riemannian metrics is of type (II).

Example 4.8 (fiber products of natural bundles of type (II)). Let $E, G : M_{f_n} \to FM_{f_n}$ be two natural bundles of type (II). It is obvious that the fiber product $E \times (G)$ is of type (II).

5. AN ORDER THEOREM

The main result of this paper is the following theorem.

Theorem 5.1. Let $F, G : M_{f_n} \to FM_{f_n}$ be two natural bundles and let $D$ be a natural differential operator of $F$ into $G$. Suppose that $F$ is of type (I) and $G$ is of type (II). Then $D$ is of order 0. Moreover, for any section $\sigma \in \Gamma FR^n$ defined near $0 \in R^n$ we have $G(t\text{id})(D_{R^n}(\sigma)(0)) = D_{R^n}(\sigma)(0)$ for all $t \in R \setminus \{0\}$.

Remark. In [1], J. Dębecki has proved that any differential operator of $T^p \otimes T^*^p$ into $T^q \otimes T^*^q$ is of order 0. Thus Theorem 5.1 is a generalization of the above fact.

Proof. Consider a section $\sigma \in \Gamma FR^n$ defined on a neighbourhood of 0. Let $\sigma_0 \in \Gamma FR^n$ be a section invariant with respect to the translations such that $j^\infty_{n+1}(t\text{id})^F\sigma) \to j_0\sigma_0$ as $t \to \infty$. Of course, $L_{\partial_1}\sigma_0 = 0$, where $\partial_1$ is the canonical vector field on $R^n$. It follows from Proposition 2.1 that $G(t\text{id})(D(\sigma)(0)) =$
\[ D((t \text{id})^\circ \sigma)(0) \rightarrow D(\sigma_0)(0) \text{ as } t \rightarrow \infty. \] Hence \( G(t \text{id})(D(\sigma)(0)) = D(\sigma)(0) = D(\sigma_0)(0) \) for all \( t \in \mathbb{R} \setminus \{0\} \), for \( G \) is of type (II). Let \( \sigma' \in \Gamma^R \mathbb{R}^n \) be another section such that \( \sigma'(0) = \sigma(0) \). Let \( \sigma'_0 \in \Gamma^R \mathbb{R}^n \) be invariant with respect to the translations such that \( j_0^\circ ((t \text{id})^\circ \sigma') \rightarrow j_0 \sigma'_0 \) as \( t \rightarrow \infty \). Then \( \sigma_0(0) = \sigma'_0(0) \), i.e. \( \sigma_0 = \sigma'_0 \). Hence \( D(\sigma)(0) = D(\sigma_0)(0) = D(\sigma'_0)(0) = D(\sigma')(0) \). Using the naturality condition we see that \( D \) is of order 0.

6. Applications

We give the following two applications of Theorem 5.1.

(I) We determine all natural differential operators of a natural bundle of type (I) into the restriction of a bundle functor.

Let \( G \) be a bundle functor and \( P \) a fixed manifold such that \( \text{card}(P) = 1 \). Let us denote by \( G^P : Mf \rightarrow FMf \) the trivial bundle functor defined as follows. For every \( M \in Mf \), \( G^P M \) is the trivial bundle \( M \times GP \) over \( M \) with the projection onto the first factor. For every map \( f \) we define \( Gf = f \times \text{id}_{GP} \). Let \( i^G_M : G^P M \rightarrow GM, M \in Mf, \) be the natural embedding given by \( i^G_M(x, y) = G\hat{x}(y) \), where \( \hat{x} : P \rightarrow \{x\} \subset M \). We prove the following corollary.

**Corollary 6.1.** Let \( F : Mf_n \rightarrow FMf_n \) be a natural bundle of type (I) and let \( G \) be a bundle functor. Then there exists a bijection between the set of all natural differential operators of \( F \) into \( G^P | Mf_n \) and the set of all natural differential operators of \( F \) into \( G | Mf_n \) given by \( \{D_M\} \rightarrow \{i^G_M \circ D_M\} \). In particular, if \( G \) has the point property, i.e. \( \text{card}(GP) = 1, \) then every natural differential operator of \( F \) into \( G | Mf_n \) is equal to the constant natural differential operator of \( F \) into \( G | Mf_n \) given by \( \gamma FM \ni \sigma \rightarrow e^G_M | \text{Dom} \sigma \in GM, e^G_M \in GM, e^G_M(x) \in i^G_M(\{x\} \times GP) \subset GxM, x \in M. \)

**Proof.** Of course, the function \( \{D_M\} \rightarrow \{i^G_M \circ D_M\} \) is a well defined injection. We prove that the function is a surjection. Let \( \hat{D} \) be a natural differential operator of \( F \) into \( G | Mf_n \). It follows from Lemma 4.1 that \( G | Mf_n \) is of type (II). By Theorem 5.1, for every section \( \sigma \in \Gamma^R \mathbb{R}^n \) defined near 0 we have \( G(t \text{id})(\hat{D}(\sigma)(0)) = \hat{D}(\sigma)(0) \) for all \( t \in \mathbb{R} \setminus \{0\} \), i.e. \( \hat{D}(\sigma)(0) \in \text{Im} i^G_M \) (see the proof of Lemma 4.1). Using the naturality condition we get that \( \text{Im} \hat{D}(\sigma) \subset \text{Im} i^G_M \) for any \( \sigma \in \Gamma FM. \)

We say that a natural bundle \( F : Mf_n \rightarrow FMf_n \) is transitive iff for every \( v, w \in F_0 \mathbb{R}^n \) there exists an embedding \( \varphi : \mathbb{R}^n \rightarrow \mathbb{R}^n \) such that \( F \varphi(v) = w \). If \( F : Mf_n \rightarrow FMf_n \) is a transitive natural bundle of type (I) (for example, the Grassmann natural bundle \( G_k \) of \( k \)-planes tangent to \( n \)-manifolds or the natural bundle \( C^p \) of torsion
free connections of order $r$ on $n$-manifolds), then we can reformulate Corollary 6.1 as follows.

**Corollary 6.1\(^*\).** Let $F : M_f \to FM_f$ be a transitive natural bundle of type (I) and let $G : M_f \to FM_f$ be a bundle functor. Let $e \in \Gamma FR^n$ be a fixed section with $\text{Dom}(e) = R^n$. Then there exists a bijection $J$ between the set of all natural differential operators of $F$ into $G|M_f$ and $GP$ ($P$ is as in Corollary 6.1) given by $J(D) = G\tilde{P}(D(e)(0))$, where $\tilde{P} : R^n \to P$. The inverse bijection $K$ is given by $K(p) = \{D^p_M\}$, where $D^p_M(\sigma)(x) = i^G_M(x, p)$ for every $\sigma \in \Gamma FM$, $x \in M$, $M \in M_f$.

**Proof.** By Corollary 6.1 we can assume that $G = G^P$. Then $(0, J(D)) = D^p_M(e)(0)$ and $D^p_M(\sigma)(x) = (x, p)$. We see that $(0, J \circ K(p)) = (0, J(\{D^p_M\})) = D^p_{R^n}(e)(0) = (0, p)$ for every $p \in GP$. Therefore $J \circ K = \text{id}$. It remains to show that $K \circ J = \text{id}$. Let $D$ be a natural differential operator of $F$ into $G^P|M_f$. Let $q = J(D) \in GP$. We have to show that $D^q_M = D_M$ for every $M \in M_f$. Of course, $D^q_{R^n}(e)(0) = (0, q) = D_{R^n}(e)(0)$. Consider $\sigma \in \Gamma FM$ and $x \in \text{Dom}(\sigma)$. Since $F$ is transitive there exists an embedding $\varphi : R^n \to M$ such that $F\varphi(0) = \sigma(x)$. By Theorem 5.1, $D$ and $D^q$ are of order 0. Using the naturality condition we deduce that $D^q_M(\sigma)(x) = D^q_M(\varphi_*)(x) = G^P\varphi(D^q_{R^n}(e)(0)) = G^P\varphi(D_{R^n}(e)(0)) = D_M(\sigma)(x)$ as well. 

(II) Using Theorem 5.1 we find all natural differential operators between Grassmann natural bundles.

**Corollary 6.2.** Let $k, l \geq 1$ be two integers such that $k, l < n$. Let $D$ be a natural differential operator of the Grassmann natural bundle $G_k$ into the Grassmann natural bundle $G_l$ over $n$-manifolds. Then $k = l$ and $D_M(\sigma) = \sigma$ for every $\sigma \in \Gamma G_kM$.

**Proof.** We know that $G_k$ is of type (I) and $G_l$ is of type (II). Let $\sigma \in \Gamma G_kR^n$ be a section defined near 0. Suppose that $D(\sigma)(0) \neq \sigma(0)$. Then there exists a linear isomorphism $\varphi : R^n \to R^n$ such that $d\varphi(\sigma(0)) = \sigma(0)$ and $d\varphi(D(\sigma)(0)) \neq D(\sigma)(0)$. On the other hand, it follows from Theorem 5.1 that $D$ is of order 0, and then $D(\sigma)(0) = D(\varphi_*\sigma)(0) = (\varphi_*D(\sigma))(0)$. This is a contradiction. Hence $D(\sigma)(0) = \sigma(0)$. Using the naturality condition we deduce that $D_M(\sigma) = \sigma$ for every $\sigma \in \Gamma G_kM$. 

**Remark.** Of course, this list of applications of Theorem 5.1 is not complete. For example, we can use Theorem 5.1 to find all natural differential operators of $G_k$ into $T^{(p,p)}$, of $T^{(p,p)}$ into $T^{(q,q)}$, of $T^{(p,p)}$ into $G_k$, of $C_r$ into $G_k$ e.t.c.
