POTENTIALLY $K_m - G$-GRAPHICAL SEQUENCES: A SURVEY

Chunhui Lai, Lili Hu, Fujian

(Received May 31, 2008)

Abstract. The set of all non-increasing nonnegative integer sequences $\pi = (d(v_1), d(v_2), \ldots, d(v_n))$ is denoted by NS_n. A sequence $\pi \in \mathrm{NS}_n$ is said to be graphic if it is the degree sequence of a simple graph G on n vertices, and such a graph G is called a realization of π. The set of all graphic sequences in NS_n is denoted by GS_n. A graphical sequence π is potentially H-graphical if there is a realization of π containing H as a subgraph, while π is forcibly H-graphical if every realization of π contains H as a subgraph. Let K_k denote a complete graph on k vertices. Let $K_m - H$ be the graph obtained from K_m by removing the edges set $E(H)$ of the graph H (H is a subgraph of K_m). This paper summarizes briefly some recent results on potentially $K_m - G$-graphic sequences and give a useful classification for determining $\sigma(H, n)$.

Keywords: graph, degree sequence, potentially $K_m - G$-graphic sequences

MSC 2010: 05C07, 05C35

1. Introduction

The set of all non-increasing nonnegative integer sequences $\pi = (d(v_1), d(v_2), \ldots, d(v_n))$ is denoted by NS_n. A sequence $\pi \in \mathrm{NS}_n$ is said to be graphic if it is the degree sequence of a simple graph G on n vertices, and such a graph G is called a realization of π. The set of all graphic sequences in NS_n is denoted by GS_n. A graphical sequence π is potentially H-graphical if there is a realization of π containing H as a subgraph, while π is forcibly H-graphical if every realization of π contains H as a subgraph. If π has a realization in which the $r+1$ vertices of largest degree induce a clique, then π is said to be potentially A_{r+1}-graphic. Let $\sigma(\pi) = d(v_1) + d(v_2) + \ldots + d(v_n)$, and $[x]$ denote the largest integer less than or equal to x. We denote by $G + H$ the graph

with $V(G+H)=V(G)\cup V(H)$ and $E(G+H)=E(G)\cup E(H)\cup\{xy\colon\ x\in V(G), y\in V(H)\}$. Let K_k, C_k, T_k, and P_k denote a complete graph on k vertices, a cycle on k vertices, a tree on $k+1$ vertices, and a path on $k+1$ vertices, respectively. Let F_k denote the friendship graph on $2k+1$ vertices, that is, the graph of k triangles intersecting in a single vertex. For $0\leqslant r\leqslant t$, denote the generalized friendship graph on $kt-kr+r$ vertices by $F_{t,r,k}$, where $F_{t,r,k}$ is the graph of k copies of K_t meeting in a common r set. We use the symbol Z_4 to denote K_4-P_2. Let K_m-H be the graph obtained from K_m by removing the edges set $E(H)$ of the graph H (H is a subgraph of K_m).

Given a graph H, what is the maximum number of edges of a graph with n vertices not containing H as a subgraph? This number is denoted $ex(n,H)$, and is known as the Turán number. In terms of graphic sequences, the number $2ex(n,H)+2$ is the minimum even integer l such that every n-term graphical sequence π with $\sigma(\pi)\geqslant l$ is forcibly H-graphical. Erdös, Jacobson and Lehel [13] first consider the following variant: determine the minimum even integer l such that every n-term graphical sequence π with $\sigma(\pi)\geqslant l$ is potentially H-graphical. We denote this minimum l by $\sigma(H,n)$. Erdös, Jacobson and Lehel [13] showed that $\sigma(K_k,n)\geqslant(k-2)(2n-k+1)+2$ and conjectured that equality holds. They proved that if π does not contain zero terms, this conjecture is true for $k=3$, $n\geqslant 6$. The conjecture was confirmed in [19] and [43]–[46]. Li et al. [46] and Mubayi [55] also independently determined the values $\sigma(K_r,2k)$ for any $k\geqslant 3$. Li and Yin [51] further determined $\sigma(K_r,n)$ for $r\geqslant 7$ and $n\geqslant 2r+1$. The problem of determining $\sigma(K_r,n)$ is completely solved.

Gould, Jacobson and Lehel [19] also proved that $\sigma(pK_2,n)=(p-1)(2n-p)+2$ for $p\geqslant 2$; $\sigma(C_4,n)=2[(1/2)(3n-1)]$ for $n\geqslant 4$. Lai [29] gave a lower bound of $\sigma(C_k,n)$ and proved that $\sigma(C_5,n)=4n-4$ for $n\geqslant 5$ and $\sigma(C_6,n)=4n-2$ for $n\geqslant 7$. Lai [32] proved that $\sigma(C_{2m+1},n)=m(2n-m-1)+2$, for $m\geqslant 2$, $n\geqslant 3m$; and $\sigma(C_{2m+2},n)=m(2n-m-1)+4$, for $m\geqslant 2$, $n\geqslant 5m-2$. Li and Luo [41] gave a lower bound for $\sigma({}_3C_l,n)$ and determined $\sigma({}_3C_l,n)$, $4\leqslant l\leqslant 6$, $n\geqslant l$. Li, Luo and Liu [42] determined $\sigma({}_3C_l,n)$ for $3\leqslant l\leqslant 8$, and $n\geqslant l$. and $\sigma({}_3C_9,n)$ for $n\geqslant 12$. Li and Yin [48] determined $\sigma({}_3C_l,n)$ for n sufficiently large. Yin, Li and Chen [68] determined $\sigma({}_kC_l,n)$, $l\geqslant 7$, $3\leqslant k\leqslant l$. Chen and Yin [9] determined the values $\sigma(W_5,n)$ for $n\geqslant 11$, where W_r is a wheel graph on r vertices. For $r\times s$ complete bipartite graph $K_{r,s}$, Gould, Jacobson and Lehel [19] determined $\sigma(K_{2,2},n)$. Yin et al. [63], [65], [69], [70] determined $\sigma(K_{r,s},n)$ for $s\geqslant r\geqslant 2$ and sufficiently large n. For $r\times s\times t$ complete 3-partite graph $K_{r,s,t}$, Erdös, Jacobson and Lehel [13] determined $\sigma(K_{1,1,1},n)$. Lai [30] determined $\sigma(K_{1,1,2},n)$. Yin [58] and Lai [34] independently determined $\sigma(K_{1,1,3},n)$. Chen [7] determined $\sigma(K_{1,1,t},n)$ for $t\geqslant 3$, $n\geqslant 2[\frac{1}{4}(t+5)^2]+3$. Chen[5] determined $\sigma(K_{1,2,2},n)$ for $5\leqslant n\leqslant 8$ and $\sigma(K_{2,2,2},n)$

for $n \geqslant 6$. Let K_s^t denote the complete t partite graph such that each partite set has exactly s vertices. Guantao Chen, Michael Ferrara, Ronald J. Gould and John R. Schmitt [11] showed that $\sigma(K_s^t, n) = \pi(K_{(t-2)s} + K_{s,s}, n)$ and obtained the exact value of $\sigma(K_j + K_{s,s}, n)$ for n sufficiently large. Consequently, they obtained the exact value of $\sigma(K_s^t, n)$ for n sufficiently large. For $n \geqslant 5$, Ferrara, Jacobson and Schmitt [17] determined $\sigma(F_k, n)$ where F_k denotes the graph of k triangles intersecting at exactly one common vertex. In [16], Ferrara, Gould and Schmitt determined a lower bound for $\sigma(K_s^t, n)$, where K_s^t denotes the complete multipartite graph with t partite sets each of size s, and proved equality in the case $s = 2$. They also provided a graph theoretic proof for the value of $\sigma(K_t, n)$. Michael J. Ferrara [15] determined $\sigma(H, n)$ for the graph $H = K_{m_1} \cup K_{m_2} \cup \ldots \cup K_{m_k}$, where n is sufficiently large integer. Ferrara, M., Jacobson, M., Schmitt, J. and Siggers M. [18] determined $\sigma(K_{s,t}, m, n)$, $\sigma(P_t, m, n)$ and $\sigma(C_{2t}, m, n)$ where $\sigma(H, m, n)$ is the minimum integer k such that every bigraphic pair $S = (A, B)$ with $|A| = m$, $|B| = n$ and $\sigma(S) \geqslant k$ is potentially H-bigraphic. For an arbitrarily chosen H, Schmitt, J. R. and Ferrara, M. [56] gave a good lower bound for $\sigma(H, n)$. Yin and Li [67] determined $\sigma(K_{r_1, r_2, \ldots, r_l, r, s}, n)$ for sufficiently large n. Moreover, Yin, Chen and Schmitt [62] determined $\sigma(F_{t,r,k}, n)$ for $k \geqslant 2, t \geqslant 3, 1 \leqslant r \leqslant t-2$ and sufficiently large, where $F_{t,r,k}$ denotes the graph of k copies of K_t meeting in a common r set. Gupta, Joshi and Tripathi [20] gave a necessary and sufficient condition for the existence of a tree of order n with a given degree set. Yin [59] gave a new necessary and sufficient condition for π to be potentially K_{r+1}-graphic. Jiong-sheng Li and Jianhua Yin [50] gave a survey on graphical sequences.

2. Potentially $K_m - G$-graphical sequences

Let H be a graph with m vertices, then $H = K_m - (K_m - H)$. Let $G = K_m - H$, then $\sigma(H, n) = \sigma(K_m - G, n)$. If Problems 1–5 in the Open Problems section are solved, then the problem of determining $\sigma(H, n)$ is completely solved. We think Problems 3 and 4 are a useful classification for determining $\sigma(H, n)$.

Gould, Jacobson and Lehel [19] pointed out that it would be nice to see where in the range from $3n-2$ to $4n-4$ the value $\sigma(K_4 - e, n)$ lies. Later, Lai [30] proved that

Theorem 1. *For $n = 4, 5$ and $n \geqslant 7$*

$$\sigma(K_4 - e, n) = \begin{cases} 3n-1 & \text{if } n \text{ is odd,} \\ 3n-2 & \text{if } n \text{ is even.} \end{cases}$$

For $n = 6$, if S is a 6-term graphical sequence with $\sigma(S) \geqslant 16$, then either there is a realization of S containing $K_4 - e$ or $S = (3^6)$. (Thus $\sigma(K_4 - e, 6) = 20$.)

Huang [26] gave a lower bound of $\sigma(K_m - e, n)$. Yin, Li and Mao [71] and Huang [27] independently determined the values $\sigma(K_5 - e, n)$ as follows.

Theorem 2. *If $n \geqslant 5$, then*

$$\sigma(K_5 - e, n) = \begin{cases} 5n - 7, & \text{if } n \text{ is odd,} \\ 5n - 6, & \text{if } n \text{ is even.} \end{cases}$$

Lai [35]–[36] determined $\sigma(K_5 - C_4, n)$, $\sigma(K_5 - P_3, n)$ and $\sigma(K_5 - P_4, n)$.

Theorem 3. *For $n \geqslant 5$, $\sigma(K_5 - C_4, n) = \sigma(K_5 - P_3, n) = \sigma(K_5 - P_4, n) = 4n - 4$.*

Yin and Li [66] gave a good method for determining the values $\sigma(K_{r+1} - e, n)$ (in fact, Yin and Li [66] also determined the values $\sigma(K_{r+1} - ke, n)$ for $r \geqslant 2$ and $n \geqslant 3r^2 - r - 1$).

Theorem 4. *Let $n \geqslant r + 1$ and $\pi = (d_1, d_2, \ldots, d_n) \in \mathrm{GS}_n$ with $d_{r+1} \geqslant r$. If $d_i \geqslant 2r - i$ for $i = 1, 2, \ldots, r - 1$, then π is potentially A_{r+1}-graphic.*

Theorem 5. *Let $n \geqslant 2r + 2$ and $\pi = (d_1, d_2, \ldots, d_n) \in \mathrm{GS}_n$ with $d_{r+1} \geqslant r$. If $d_{2r+2} \geqslant r - 1$, then π is potentially A_{r+1}-graphic.*

Theorem 6. *Let $n \geqslant r + 1$ and $\pi = (d_1, d_2, \ldots, d_n) \in \mathrm{GS}_n$ with $d_{r+1} \geqslant r - 1$. If $d_i \geqslant 2r - i$ for $i = 1, 2, \ldots, r - 1$, then π is potentially $K_{r+1} - e$-graphic.*

Theorem 7. *Let $n \geqslant 2r + 2$ and $\pi = (d_1, d_2, \ldots, d_n) \in \mathrm{GS}_n$ with $d_{r-1} \geqslant r$. If $d_{2r+2} \geqslant r - 1$, then π is potentially $K_{r+1} - e$-graphic.*

Theorem 8. *If $r \geqslant 2$ and $n \geqslant 3r^2 - r - 1$, then*

$$\sigma(K_{r+1} - ke, n) = \begin{cases} (r-1)(2n-r) - (n-r) + 1 & \text{if } n - r \text{ is odd,} \\ (r-1)(2n-r) - (n-r) + 2 & \text{if } n - r \text{ is even.} \end{cases}$$

After reading [66], Yin [72] determined the values $\sigma(K_{r+1} - K_3, n)$ for $r \geqslant 3$, $n \geqslant 3r + 5$.

Theorem 9. *If $r \geqslant 3$ and $n \geqslant 3r+5$, then $\sigma(K_{r+1} - K_3, n) = (r-1)(2n-r) - 2(n-r) + 2$.*

Determining $\sigma(K_{r+1} - H, n)$, where H is a tree on 4 vertices, is more useful than a cycle on 4 vertices (for example, $C_4 \not\subset C_i$, but $P_3 \subset C_i$ for $i \geqslant 5$). So, after reading [66] and [72], Lai and Hu [38] determined $\sigma(K_{r+1} - H, n)$ for $n \geqslant 4r+10$, $r \geqslant 3$, $r+1 \geqslant k \geqslant 4$ and H a graph on k vertices which containing a tree on 4 vertices but does not contain a cycle on 3 vertices and $\sigma(K_{r+1} - P_2, n)$ for $n \geqslant 4r+8$, $r \geqslant 3$.

Theorem 10. *If $r \geqslant 3$ and $n \geqslant 4r+8$, then $\sigma(K_{r+1} - P_2, n) = (r-1)(2n-r) - 2(n-r) + 2$.*

Theorem 11. *If $r \geqslant 3$, $r+1 \geqslant k \geqslant 4$ and $n \geqslant 4r+10$, then $\sigma(K_{r+1} - H, n) = (r-1)(2n-r) - 2(n-r)$, where H is a graph on k vertices which contains a tree on 4 vertices but not contains a cycle on 3 vertices.*

There are a number of graphs on k vertices which contain a tree on 4 vertices but do not containing a cycle on 3 vertices (for example, the cycle on k vertices, the tree on k vertices, and the complete 2-partite graph on k vertices, etc).

Lai and Sun [39] determined $\sigma(K_{r+1} - (kP_2 \cup tK_2), n)$ for $n \geqslant 4r+10$, $r+1 \geqslant 3k+2t$, $k+t \geqslant 2$, $k \geqslant 1$, $t \geqslant 0$.

Theorem 12. *If $n \geqslant 4r+10$, $r+1 \geqslant 3k+2t$, $k+t \geqslant 2$, $k \geqslant 1$, $t \geqslant 0$, then $\sigma(K_{r+1} - (kP_2 \cup tK_2), n) = (r-1)(2n-r) - 2(n-r)$.*

As yet, the problem of determining $\sigma(K_{r+1} - H, n)$ for H not containing a cycle on 3 vertices and n sufficiently large has not been solved.

Lai [37] determined $\sigma(K_{r+1} - Z, n)$ for $n \geqslant 5r+19$, $r+1 \geqslant k \geqslant 5$, $j \geqslant 5$ and Z a graph on k vertices and j edges which contains a graph Z_4 but does not contain a cycle on 4 vertices. In the same paper, the author also determined the values of $\sigma(K_{r+1} - Z_4, n)$, $\sigma(K_{r+1} - (K_4 - e), n)$ and $\sigma(K_{r+1} - K_4, n)$ for $n \geqslant 5r+16$, $r \geqslant 4$.

Theorem 13. *If $r \geqslant 4$ and $n \geqslant 5r+16$, then*

$$\sigma(K_{r+1} - K_4, n) = \sigma(K_{r+1} - (K_4 - e), n) =$$

$$\sigma(K_{r+1} - Z_4, n) = \begin{cases} (r-1)(2n-r) - 3(n-r) + 1 & \text{if } n-r \text{ is odd,} \\ (r-1)(2n-r) - 3(n-r) + 2 & \text{if } n-r \text{ is even.} \end{cases}$$

Theorem 14. *If $n \geqslant 5r+19$, $r+1 \geqslant k \geqslant 5$, and $j \geqslant 5$, then*

$$\sigma(K_{r+1}-Z,n)=\begin{cases}(r-1)(2n-r)-3(n-r)-1 & \text{if } n-r \text{ is odd,}\\ (r-1)(2n-r)-3(n-r)-2 & \text{if } n-r \text{ is even}\end{cases}$$

where Z is a graph on k vertices and j edges which contains a graph Z_4 but does not contain a cycle on 4 vertices.

There are a number of graphs on k vertices and j edges which contain a graph Z_4 but do not contain a cycle on 4 vertices. (For example, the graph obtained by $C_3, C_{i_1}, C_{i_2}, \ldots, C_{i_p}$ intersecting in a single vertex ($i_j \neq 4, j=1,2,3,\ldots,p$) (if $i_j=3$, $j=1,2,3,\ldots,p$, then this graph is the friendship graph F_{p+1}), the graph obtained by $C_3, P_{i_1}, P_{i_2}, \ldots, P_{i_p}$ intersecting in a single vertex ($i_1 \geqslant 1$), the graph obtained by $C_3, P_{i_1}, C_{i_2}, \ldots, C_{i_p}$ ($i_j \neq 4$, $j=2,3,\ldots,p$, $i_1 \geqslant 1$) intersecting in a single vertex, etc.)

Lai and Yan [40] proved that

Theorem 15. *If $n \geqslant 5r+18$, $r+1 \geqslant k \geqslant 7$, and $j \geqslant 6$, then*

$$\sigma(K_{r+1}-U,n)=\begin{cases}(r-1)(2n-r)-3(n-r)-1 & \text{if } n-r \text{ is odd,}\\ (r-1)(2n-r)-3(n-r) & \text{if } n-r \text{ is even}\end{cases}$$

where U is a graph on k vertices and j edges which contains a graph $(K_3 \cup P_3)$ but does not contain a cycle on 4 vertices and not contains Z_4.

There are a number of graphs on k vertices and j edges which contains a graph $(K_3 \cup P_3)$ but do not contain a cycle on 4 vertices and do not contain Z_4. (For example, $C_3 \cup C_{i_1} \cup C_{i_2} \cup \ldots \cup C_{i_p}$ ($i_j \neq 4, j=2,3,\ldots,p, i_1 \geqslant 5$), $C_3 \cup P_{i_1} \cup P_{i_2} \cup \ldots \cup P_{i_p}$ ($i_1 \geqslant 3$), $C_3 \cup P_{i_1} \cup C_{i_2} \cup \ldots \cup C_{i_p}$ ($i_j \neq 4$, $j=2,3,\ldots,p$, $i_1 \geqslant 3$), etc.)

A harder question is to characterize the potentially H-graphic sequences without zero terms. Luo [53] characterized the potentially C_k-graphic sequences for each $k=3,4,5$.

Theorem 16. *Let $\pi=(d_1,d_2,\ldots,d_n)$ be a graphic sequence with $n \geqslant 3$. Then π is potentially C_3-graphic if and only if $d_3 \geqslant 2$ except for 2 case: $\pi=(2^4)$ and $\pi=(2^5)$.*

Theorem 17. *Let $\pi=(d_1,d_2,\ldots,d_n)$ be a graphic sequence with $n \geqslant 4$. Then π is potentially C_4-graphic if and only if the following conditions hold:*

(1) $d_4 \geqslant 2$.

(2) $d_1=n-1$ *implies* $d_2 \geqslant 3$.

(3) *If* $n=5,6$, *then* $\pi \neq (2^n)$.

Theorem 18. *Let $\pi = (d_1, d_2, \ldots, d_n)$ be a graphic sequence with $n \geqslant 5$. Then π is potentially C_5-graphic if and only if the following conditions hold:*
(1) $d_5 \geqslant 2$.
(2) *For $i = 1, 2$, $d_1 = n - i$ implies $d_{4-i} \geqslant 3$.*
(3) *If $\pi = (d_1, d_2, 2^k, 1^{n-k-2})$, then $d_1 + d_2 \leqslant n + k - 2$.*

Chen [2] characterized the potentially C_k-graphic sequences for $k = 6$.

Theorem 19. *Let $\pi = (d_1, d_2, \ldots, d_n)$ be a graphic sequence with $n \geqslant 6$. Then π is potentially C_6-graphic if and only if the following conditions hold:*
(1) $d_6 \geqslant 2$.
(2) *If $n = 7, 8$, then $\pi \neq (2^n)$.*
(3) *For $i = 1, 2, 3$, $d_1 = n - i$ implies $d_{5-i} \geqslant 3$.*
(4) *If $\pi = (d_1, d_2, 2^k, 1^{n-k-2})$, then $d_1 + d_2 \leqslant n + k - 2$; if $\pi = (d_1, d_2, 3, 2^k, 1^{n-k-3})$, then $d_1 + d_2 \leqslant n + k$; if $\pi = (d_1, d_2, 3, 3, 2^k, 1^{n-k-4})$, then $d_1 + d_2 \leqslant n + k + 2$.*

Yin, Chen and Chen [60] characterized the potentially ${}_kC_l$-graphic sequences for each $k = 3, 4 \leqslant l \leqslant 5$ and $k = 4$, $l = 5$.

Theorem 20. *Let $\pi = (d_1, d_2, \ldots, d_n) \in \mathrm{GS}_n$ be a potentially C_4-graphic sequence. Then π is potentially ${}_3C_4$-graphic if and only if π satisfies one of the following conditions:*
(1) *$d_2 \geqslant 3$ and $\pi \neq (3^2, 2^4)$;*
(2) *$\pi = (d_1, 2^k, 1^{n-k-1})$ with $2 \leqslant d_1 \leqslant 3$ and $k \geqslant 6$, and $\pi \neq (2^8)$ and (2^9);*
(3) *$\pi = (d_1, 2^k, 1^{n-k-1})$ with $4 \leqslant d_1 \leqslant n - 2$ and $k \geqslant 5$, and $\pi \neq (4, 2^6)$ and $(4, 2^7)$.*

Theorem 21. *Let $\pi = (d_1, d_2, \ldots, d_n) \in \mathrm{GS}_n$ be a potentially C_5-graphic sequence. Then π is potentially ${}_3C_5$-graphic if and only if π satisfies one of the following conditions:*
(1) *$d_2 \geqslant 3$ and $\pi \neq (3^2, 2^4)$ and $(3^2, 2^5)$;*
(2) *$\pi = (d_1, 2^k, 1^{n-k-1})$ with $2 \leqslant d_1 \leqslant 3$ and $k \geqslant 11$, and $\pi \neq (2^{13})$ and (2^{14});*
(3) *$\pi = (d_1, 2^k, 1^{n-k-1})$ with $4 \leqslant d_1 \leqslant 5$ and $k \geqslant 10$, and $\pi \neq (4, 2^{11})$ and $(4, 2^{12})$;*
(4) *$\pi = (d_1, 2^k, 1^{n-k-1})$ with $6 \leqslant d_1 \leqslant n - 4$ and $k \geqslant 9$, and $\pi \neq (4, 2^{10})$ and $(4, 2^{11})$.*

Theorem 22. *Let $\pi = (d_1, d_2, \ldots, d_n) \in \mathrm{GS}_n$ be a potentially C_5-graphic sequence. Then π is potentially ${}_4C_5$-graphic if and only if π satisfies one of the following conditions:*
(1) *$d_2 \geqslant 3$;*
(2) *$\pi = (d_1, 2^k, 1^{n-k-1})$ with $2 \leqslant d_1 \leqslant 3$ and $k \geqslant 8$, and $\pi \neq (2^{10})$ and (2^{11});*

(3) $\pi = (d_1, 2^k, 1^{n-k-1})$ *with* $4 \leqslant d_1 \leqslant n-4$ *and* $k \geqslant 7$, *and* $\pi \neq (4, 2^8)$ *and* $(4, 2^9)$.

Chen, Yin and Fan [10] characterized the potentially ${}_kC_l$-graphic sequences for each $3 \leqslant k \leqslant 5, l = 6$.

Theorem 23. *Let* $\pi = (d_1, d_2, \ldots, d_n) \in \mathrm{GS}_n$, $n \geqslant 6$, *and* $\pi \neq (3^2, 2^{10})$, (2^{19}), (2^{20}), $(4, 2^{17})$, $(4, 2^{18})$, $(6, 2^{16})$, $(6, 2^{17})$, $(8, 2^{15})$, $(8, 2^{16})$. *Then* π *is potentially* ${}_3C_6$-*graphic if and only if* π *be a potentially* C_6-*graphic sequence, and* π *satisfies one of the following conditions:*

(1) $d_3 \geqslant 3$, *and if* $d_1 = d_3 = 3$, $d_4 = 2$, *then* $d_{10} = 2$;

(2) $d_2 \geqslant 4$, $d_3 = 2$, $d_7 = 2$;

(3) $d_2 = 3$, $d_3 = 2$, *and if* $4 \geqslant d_1 \geqslant 3$, *then* $d_{10} = 2$, *and if* $n-4 \geqslant d_1 \geqslant 5$, *then* $d_9 = 2$;

(4) $d_2 = 2$, *and if* $3 \geqslant d_1 \geqslant 2$, *then* $d_{18} = 2$, *and if* $5 \geqslant d_1 \geqslant 4$, *then* $d_{17} = 2$, *and if* $7 \geqslant d_1 \geqslant 6$, *then* $d_{16} = 2$, *and if* $n-7 \geqslant d_1 \geqslant 8$, *then* $d_{15} = 2$.

Luo and Warner [54] characterized the potentially K_4-graphic sequences.

Theorem 26. *Let* $\pi = (d_1, d_2, \ldots, d_n)$ *be a graphic sequence without zero terms and with* $d_4 \geqslant 3$ *and* $n \geqslant 4$. *Then* π *is potentially* K_4-*graphic if and only if* $d_4 \geqslant 3$ *and* $\pi \neq (n-1, 3^s, 1^{n-s-1})$ *for each* $s = 4, 5$ *except the following sequences:*

$n = 5$: $(4, 3^4)$, $(3^4, 2)$;

$n = 6$: (4^6), $(4^2, 3^4)$, $(4, 3^4, 2)$, (3^6), $(3^5, 1)$, $(3^4, 2^2)$;

$n = 7$: (4^7), $(4^3, 3^4)$, $(4, 3^6)$, $(4, 3^5, 1)$, $(3^6, 2)$, $3^5, 2, 1)$;
$n = 8$: $(3^7, 1)$, $(3^6, 1^2)$.

Eschen and Niu [14] and Lai [31] independently characterized the potentially $K_4 - e$-graphic sequences.

Theorem 27. *Let $\pi = (d_1, d_2, \ldots, d_n)$ be a graphic sequence with $n \geqslant 4$. Then π is potentially $(K_4 - e)$-graphic if and only if the following conditions hold:*
(1) $d_2 \geqslant 3$.
(2) $d_4 \geqslant 2$.
(3) *If $n = 5, 6$, then $\pi \neq (3^2, 2^{n-2})$ and $\pi \neq (3^6)$.*

Yin and Yin [73] characterized the potentially $K_5 - e$ and K_6-graphic sequences.

Theorem 28. *Let $n \geqslant 5$ and $\pi = (d_1, d_2, \ldots, d_n) \in \mathrm{NS}_n$ be a positive graphic sequence with $d_3 \geqslant 4$ and $d_5 \geqslant 3$. Then π is potentially $K_5 - e$-graphic if and only if π is not one of the following sequences:* $(n-1, 4^6, 1^{n-7})$, $(n-1, 4^2, 3^4, 1^{n-7})$, $(n-1, 4^2, 3^3, 1^{n-6})$;
$n = 6$: $(4^6), (4^4, 3^2), (4^3, 3^2, 2)$;
$n = 7$: $(4^3, 3^4)$, $(5^2, 4, 3^4)$, (4^7), $(4^5, 3^2)$, $(5, 4^3, 3^3)$, $(5^2, 4^5)$, $(5, 4^5, 3)$, $(4^3, 3^2, 2^2)$, $(4^4, 3^2, 2)$, $(5, 4^2, 3^3, 2)$, $(4^6, 2)$, $(4^3, 3^3, 1)$;
$n = 8$: (5^8), (4^8), $(5^2, 4^6)$, $(6, 4^7)$, $(4^4, 3^4)$, $(5, 4^2, 3^5)$, $(4^6, 3^2)$, $(5, 4^6, 3)$, $(4^3, 3^4, 2)$, $(4^7, 2)$, $(4^4, 3^3, 1)$, $(5, 4^2, 3^4, 1)$, $(4^3, 3^3, 2, 1)$, $(4^6, 3, 1)$, $(5, 4^6, 1)$;
$n = 9$: (4^9), $(4^3, 3^5, 1)$, $(4^8, 2)$, $(4^7, 3, 1)$, $(5, 4^7, 1)$, $(4^3, 3^4, 1^2)$, $(4^7, 1^2)$;
$n = 10$: $(4^8, 1^2)$.

Theorem 29. *Let $n \geqslant 18$ and $\pi = (d_1, d_2, \ldots, d_n) \in \mathrm{NS}_n$ be a positive graphic sequence with $d_6 \geqslant 5$. Then π is potentially A_6-graphic if and only if $\pi_6 \notin \{(2), (2^2), (3, 1), (3^2), (3, 2, 1), (3^2, 2), (3^3, 1), (3^2, 1^2)\}$.*

Yin and Chen [61] characterized the potentially $K_{r,s}$-graphic sequences for $r = 2$, $s = 3$ and $r = 2$, $s = 4$.

Theorem 30. *Let $n \geqslant 5$ and $\pi = (d_1, d_2, \ldots, d_n) \in \mathrm{GS}_n$. Then π is potentially $K_{2,3}$-graphic if and only if π satisfies the following conditions:*
(1) *$d_2 \geqslant 3$ and $d_5 \geqslant 2$;*
(2) *if $d_1 = n - 1$ and $d_2 = 3$, then $d_5 = 3$;*
(3) *$\pi \neq (3^2, 2^4)$, $(3^2, 2^5)$, $(4^3, 2^3)$, $(n-1, 3^5, 1^{n-6})$ and $(n-1, 3^6, 1^{n-7})$.*

Theorem 31. *Let $n \geqslant 6$ and $\pi = (d_1, d_2, \ldots, d_n) \in \mathrm{GS}_n$. Then π is potentially $K_{2,4}$-graphic if and only if π satisfies the following conditions:*

(1) $d_2 \geqslant 4$ *and* $d_6 \geqslant 2$;

(2) *if* $d_1 = n-1$ *and* $d_2 = 4$, *then* $d_3 = 4$ *and* $d_6 \geqslant 3$;

(3) $\pi \neq (4^3, 2^4)$, $(4^2, 2^5)$, $(4^2, 2^6)$, $(5^2, 4, 2^4)$, $(5^3, 3, 2^3)$, $(6, 5^2, 2^5)$, $(5^3, 2^4, 1)$, $(6^3, 2^6)$, $(n-1, 4^2, 3^4, 1^{n-7})$, $(n-1, 4^2, 3^5, 1^{n-8})$, $(n-2, 4^2, 2^3, 1^{n-6})$, *and* $(n-2, 4^3, 2^2, 1^{n-6})$.

Chen [3] characterized the potentially $K_5 - 2K_2$-graphic sequences for $5 \leqslant n \leqslant 8$. Hu and Lai [23] characterized the potentially $K_5 - P_3$, $K_5 - A_3$, $K_5 - K_3$, $K_5 - K_{1,3}$ and $K_5 - 2K_2$-graphic sequences where A_3 is $P_2 \cup K_2$.

Theorem 32. *Let $\pi = (d_1, d_2, \ldots, d_n)$ be a graphic sequence with $n \geqslant 5$. Then π is potentially $K_5 - P_3$-graphic if and only if the following conditions hold:*

(1) $d_1 \geqslant 4$, $d_3 \geqslant 3$ *and* $d_5 \geqslant 2$.

(2) $\pi \neq (4, 3^2, 2^3)$, $(4, 3^2, 2^4)$ *and* $(4, 3^6)$.

Theorem 33. *Let $\pi = (d_1, d_2, \ldots, d_n)$ be a graphic sequence with $n \geqslant 5$. Then π is potentially $K_5 - A_3$-graphic if and only if the following conditions hold:*

(1) $d_4 \geqslant 3$ *and* $d_5 \geqslant 2$.

(2) $\pi \neq (n-1, 3^3, 2^{n-k}, 1^{k-4})$ *where* $n \geqslant 6$ *and* $k = 4, 5, \ldots, n-2$, n *and* k *have the same parity.*

(3) $\pi \neq (3^4, 2^2)$, (3^6), $(3^4, 2^3)$, $(3^6, 2)$, $(4, 3^6)$, $(3^7, 1)$, (3^8), $(n-1, 3^5, 1^{n-6})$ *and* $(n-1, 3^6, 1^{n-7})$.

Theorem 34. *Let $\pi = (d_1, d_2, \ldots, d_n)$ be a graphic sequence with $n \geqslant 5$. Then π is potentially $K_5 - K_3$-graphic if and only if the following conditions hold:*

(1) $d_2 \geqslant 4$ *and* $d_5 \geqslant 2$.

(2) $\pi \neq (4^2, 2^4)$, $(4^2, 2^5)$, $(4^3, 2^3)$ *and* (4^6).

Theorem 35. *Let $\pi = (d_1, d_2, \ldots, d_n)$ be a graphic sequence with $n \geqslant 5$. Then π is potentially $K_5 - K_{1,3}$-graphic if and only if the following conditions hold:*

(1) $d_1 \geqslant 4$ *and* $d_4 \geqslant 3$.

(2) $\pi \neq (4, 3^4, 2)$, (4^6), $(4^2, 3^4)$, $(4, 3^6)$, (4^7), $(4, 3^5, 1)$, $(n-1, 3^4, 1^{n-5})$ *and* $(n-1, 3^5, 1^{n-6})$.

Theorem 36. *Let $\pi = (d_1, d_2, \ldots, d_n)$ be a graphic sequence with $n \geqslant 5$. Then π is potentially $K_5 - 2K_2$-graphic if and only if the following conditions hold:*
(1) $d_1 \geqslant 4$ *and* $d_5 \geqslant 3$;
(2)

$$\pi \neq \begin{cases} (n-i, n-j, 3^{n-i-j-2k}, 2^{2k}, 1^{i+j-2}), & n-i-j \text{ is even;} \\ (n-i, n-j, 3^{n-i-j-2k-1}, 2^{2k+1}, 1^{i+j-2}), & n-i-j \text{ is odd.} \end{cases}$$

where $1 \leqslant j \leqslant n-5$ *and* $0 \leqslant k \leqslant [\frac{1}{2}(n-j-i-4)]$.
(3) $\pi \neq (4^2, 3^4)$, $(4, 3^4, 2)$, $(5, 4, 3^5)$, $(5, 3^5, 2)$, (4^7), $(4^3, 3^4)$, $(4^2, 3^4, 2)$, $(4, 3^6)$, $(4, 3^5, 1)$,$(4, 3^4, 2^2)$, $(5, 3^7)$, $(5, 3^6, 1)$, (4^8), $(4^2, 3^6)$, $(4^2, 3^5, 1)$, $(4, 3^6, 2)$, $(4, 3^5, 2, 1)$, $(4, 3^7, 1)$, $(4, 3^6, 1^2)$, $(n-1, 3^5, 1^{n-6})$ *and* $(n-1, 3^6, 1^{n-7})$.

Hu and Lai [21] characterized the potentially $K_5 - C_4$-graphic sequences.

Theorem 37. *Let $\pi = (d_1, d_2, \ldots, d_n)$ be a graphic sequence with $n \geqslant 5$. Then π is potentially $(K_5 - C_4)$-graphic if and only if the following conditions hold:*
(1) $d_1 \geqslant 4$.
(2) $d_5 \geqslant 2$.
(3) $\pi \neq ((n-2)^2, 2^{n-2})$ *for* $n \geqslant 6$, *where the symbol* x^y *stands for* y *consecutive terms* x.
(4) $\pi \neq (n-k, k+i, 2^i, 1^{n-i-2})$ *where* $i = 3, 4, \ldots, n-2k$ *and* $k = 1, 2, \ldots, [\frac{1}{2}(n-1)] - 1$.
(5) *If* $n = 6$, *then* $\pi \neq (4, 2^5)$.
(6) *If* $n = 7$, *then* $\pi \neq (4, 2^6)$.

Hu and Lai [22] characterized the potentially $K_5 - Z_4$-graphic sequences.

Theorem 38. *Let $\pi = (d_1, d_2, \ldots, d_n)$ be a graphic sequence with $n \geqslant 5$. Then π is potentially $(K_5 - Z_4)$-graphic if and only if the following conditions hold:*
(1) $d_1 \geqslant 4$, $d_2 \geqslant 3$ *and* $d_4 \geqslant 2$.

Hu, Lai and Wang [25] characterized the potentially $K_5 - P_4$ and $K_5 - Y_4$-graphic sequences where Y_4 is a tree on 5 vertices and 3 leaves.

Theorem 39. *Let $\pi = (d_1, d_2, \ldots, d_n)$ be a graphic sequence with $n \geqslant 5$. Then π is potentially $K_5 - P_4$-graphic if and only if the following conditions hold:*
(1) $d_2 \geqslant 3$.
(2) $d_5 \geqslant 2$.
(3) $\pi \neq (n-1, k, 2^t, 1^{n-2-t})$ *where* $n \geqslant 5$, $k, t = 3, 4, \ldots, n-2$, *and,* k *and* t *have different parities.*

(4) *For* $n \geqslant 5$, $\pi \neq (n-k, k+i, 2^i, 1^{n-i-2})$ *where* $i = 3, 4, \dots, n-2k$ *and* $k = 1, 2, \dots, [\frac{1}{2}(n-1)] - 1$.
(5) *If* $n = 6, 7$, *then* $\pi \neq (3^2, 2^{n-2})$.

Theorem 40. *Let* $\pi = (d_1, d_2, \dots, d_n)$ *be a graphic sequence with* $n \geqslant 5$. *Then* π *is potentially* $K_5 - Y_4$*-graphic if and only if the following conditions hold:*
(1) $d_3 \geqslant 3$.
(2) $d_4 \geqslant 2$.
(3) $\pi \neq (3^6)$.

Hu and Lai [24] characterized the potentially $K_{3,3}$ and $K_6 - C_6$-graphic sequences.

Theorem 41. *Let* $\pi = (d_1, d_2, \dots, d_n)$ *be a graphic sequence with* $n \geqslant 6$. *Then* π *is potentially* $K_{3,3}$*-graphic if and only if the following conditions hold:*
(1) $d_6 \geqslant 3$;
(2) *for* $i = 1, 2$, $d_1 = n - i$ *implies* $d_{4-i} \geqslant 4$;
(3) $d_2 = n - 1$ *implies* $d_3 \geqslant 5$ *or* $d_6 \geqslant 4$;
(4) $d_1 + d_2 = 2n - i$ *and* $d_{n-i+3} = 1 (3 \leqslant i \leqslant n-4)$ *implies* $d_3 \geqslant 5$ *or* $d_6 \geqslant 4$;
(5) $d_1 + d_2 = 2n - i$ *and* $d_{n-i+4} = 1 (4 \leqslant i \leqslant n-3)$ *implies* $d_3 \geqslant 4$;
(6) $\pi = (d_1, d_2, 3^4, 2^t, 1^{n-6-t})$ *or* $(d_1, d_2, 4^2, 3^2, 2^t, 1^{n-6-t})$ *implies* $d_1 + d_2 \leqslant n + t + 2$;
(7) $\pi = (d_1, d_2, 4, 3^4, 2^t, 1^{n-7-t})$ *implies* $d_1 + d_2 \leqslant n + t + 3$;
(8) *for* $t = 5, 6$, $\pi \neq (n-i, k+i, 4^t, 2^{k-t}, 1^{n-2-k})$ *where* $i = 1, \dots, [\frac{1}{2}(n-k)]$ *and* $k = t, \dots, n-2i$;
(9) $\pi \neq (5^4, 3^2, 2)$, (4^6), $(3^6, 2)$, $(6^4, 3^4)$, $(4^2, 3^6)$, $(4, 3^6, 2)$, $(3^6, 2^2)$, (3^8), $(3^7, 1)$, $(4, 3^8)$, $(4, 3^7, 1)$, $(3^8, 2)$, $(3^7, 2, 1)$, $(3^9, 1)$, $(3^8, 1^2)$, $(n-1, 4^2, 3^4, 1^{n-7})$, $(n-1, 4^2, 3^5, 1^{n-8})$, $(n-1, 5^3, 3^3, 1^{n-7})$, $(n-2, 4, 3^5, 1^{n-7})$, $(n-2, 4, 3^6, 1^{n-8})$, $(n-3, 3^6, 1^{n-7})$, $(n-3, 3^7, 1^{n-8})$.

Theorem 42. *Let* $\pi = (d_1, d_2, \dots, d_n)$ *be a graphic sequence with* $n \geqslant 6$. *Then* π *is potentially* $K_6 - C_6$*-graphic if and only if the following conditions hold:*
(1) $d_6 \geqslant 3$;
(2) *for* $i = 1, 2$, $d_1 = n - i$ *implies* $d_{4-i} \geqslant 4$;
(3) $d_2 = n - 1$ *implies* $d_4 \geqslant 4$;
(4) $d_1 + d_2 = 2n - i$ *and* $d_{n-i+3} = 1 (3 \leqslant i \leqslant n-4)$ *implies* $d_4 \geqslant 4$;
(5) $d_1 + d_2 = 2n - i$ *and* $d_{n-i+4} = 1 (4 \leqslant i \leqslant n-3)$ *implies* $d_3 \geqslant 4$;
(6) $\pi = (d_1, d_2, d_3, 3^k, 2^t, 1^{n-3-k-t})$ *implies* $d_1 + d_2 + d_3 \leqslant n + 2k + t + 1$;
(7) $\pi = (d_1, d_2, 3^4, 2^t, 1^{n-6-t})$ *implies* $d_1 + d_2 \leqslant n + t + 2$;
(8) $\pi \neq (n-i, k, t, 3^t, 2^{k-i-t-1}, 1^{n-2-k+i})$ *where* $i = 1, \dots, [\frac{1}{2}(n-t-1)]$ *and* $k = i + t + 1, \dots, n - i$ *and* $t = 4, 5, \dots, k - i - 1$;

(9) $\pi \neq (3^6,2)$, $(4^2,3^6)$, $(4,3^6,2)$, $(3^6,2^2)$, (3^8), $(3^7,1)$, $(4,3^8)$, $(4,3^7,1)$, $(3^8,2)$, $(3^7,2,1)$, $(3^9,1)$, $(3^8,1^2)$, $(n-1,4^2,3^4,1^{n-7})$, $(n-1,4^2,3^5,1^{n-8})$, $(n-2,4,3^5,1^{n-7})$, $(n-2,4,3^6,1^{n-8})$, $(n-3,3^6,1^{n-7})$, $(n-3,3^7,1^{n-8})$.

Xu and Hu [57] characterized the potentially $K_{1,4}+e$-graphic sequences. Chen and Li [8] characterized the potentially $K_{1,t}+e$-graphic sequences.

Theorem 43. *Let $\pi=(d_1,d_2,\ldots,d_n)$ be a graphic sequence with $n \geqslant 5$. Then π is potentially $K_{1,4}+e$-graphic if and only if $d_1 \geqslant 4$, $d_3 \geqslant 2$.*

Theorem 44. *Let $t \geqslant 3$, $\pi=(d_1,d_2,\ldots,d_n)$ is a graphic sequence with $n \geqslant t+1$. Then π is potentially $K_{1,t}+e$-graphic if and only if $d_1 \geqslant t$, $d_3 \geqslant 2$.*

Open problems

Problem 1. Determine $\sigma(K_{r+1}-G,n)$ for G is a graph on k vertices and j edges which contains a graph $K_3 \cup K_{1,3}$ but does not contain a cycle on 4 vertices and does not contain Z_4 and P_3.

Problem 2. Determine $\sigma(K_{r+1}-G,n)$ for $G=K_3 \cup iK_2 \cup jP_2 \cup tK_3$.

Problem 3. Determine $\sigma(K_{r+1}-G,n)$ for graph G which contains $C_3, C_4, \ldots, C_l$ but does not contain a cycle on $l+1$ vertices ($4 \leqslant l \leqslant r$).

Problem 4. Determine $\sigma(K_{r+1}-G,n)$ for a graph G which contains C_3, $C_4, \ldots, C_{r+1}$.

Problem 5. Determine $\sigma(K_{r+1}-G,n)$ for small n.

Problem 6. Characterize potentially $K_{r+1}-G$-graphic sequences for the remaining G.

Acknowledgment. The first author is particularly indebted to Professor Jiongsheng Li for introducing him to degree sequences. The authors wish to thank Professor Gang Chen, R. J. Gould, Jiongsheng Li, Rong Luo, John R. Schmitt, Zi-Xia Song, Amitabha Tripathi, Jianhua Yin and Mengxiao Yin for sending some of their papers to us.
