# THE FIRST EIGENVALUE OF SPACELIKE SUBMANIFOLDS IN INDEFINITE SPACE FORM $R_{p}^{n+p}$ 

Yingbo Han and Shuxiang Feng

#### Abstract

In this paper, we prove that the first eigenvalue of a complete spacelike submanifold in $R_{p}^{n+p}$ with the bounded Gauss map must be zero.

## 1. Introduction

Let $M^{n}$ be a complete noncompact Riemannian manifold and $\Omega \subset M^{n}$ be a domain with compact closure and nonempty boundary $\partial \Omega$. The Dirichlet eigenvalue $\lambda_{1}(\Omega)$ of $\Omega$ is defined by

$$
\lambda_{1}(\Omega)=\inf \left(\frac{\int_{\Omega}|\nabla f|^{2} d M}{\int_{M} f^{2} d M}: f \in L_{1,0}^{2}(\Omega)\{0\}\right),
$$

where $d M$ is the volume element on $M^{n}$ and $L_{1,0}^{2}(\Omega)$ the completion of $C_{0}^{\infty}$ with respect to the norm

$$
\|\varphi\|_{\Omega}^{2}=\int_{M} \varphi^{2} d M+\int_{M}|\nabla \varphi|^{2} d M .
$$

If $\Omega_{1} \subset \Omega_{2}$ are bounded domains, then $\lambda_{1}\left(\Omega_{1}\right) \geq \lambda_{1}\left(\Omega_{2}\right) \geq 0$. Thus one may define the first Dirichlet eigenvalue of $M^{n}$ as the following limit

$$
\lambda_{1}(M)=\lim _{r \rightarrow \infty} \lambda_{1}(B(p, r)) \geq 0
$$

where $B(p, r)$ is the geodesic ball of $M^{n}$ with radius $r$ centered at $p$. It is clear that the definition of $\lambda_{1}(M)$ does not depend on the center point $p$. It is interesting to ask that for what geometries a noncompact manifold $M^{n}$ has zero first eigenvalue. Cheng and Yau [1] showed that $\lambda_{1}(M)=0$ if $M^{n}$ has polynomial volume growth.

In [5], B. Wu proved the following result.
Theorem A. Let $M^{n}$ be a complete spacelike hypersurface in $R_{1}^{n+1}$ whose Gauss map is bounded, then $\lambda_{1}(M)=0$.

In this note, we discover that Wu's result still holds for higher codimensional complete spacelike submanifolds in $R_{p}^{n+p}$. In fact, we prove

[^0]Theorem 3.1. Let $M^{n}$ be a complete spacelike submanifold in $R_{p}^{n+p}$ whose Gauss map is bounded, then $\lambda_{1}(M)=0$.

## 2. The geometry of pseudo-Grassmannian

In this section we review some basic properties about the geometry of pseudo--Grassmannian. For details one referred to see [6, 3].

Let $R_{p}^{n+p}$ be the $(n+p)$-dimensional pseudo-Euclidean space with index $p$, where, for simplicity, we assume that $n \geq p$. The case $n<p$ can be treated similarly. We choose a pseudo-Euclidean frame field $\left\{e_{1}, \ldots, e_{n+p}\right\}$ such that the pseudo-Euclidean metric of $R_{p}^{n+p}$ is given by $d s^{2}=\sum_{i}\left(\omega_{i}\right)^{2}-\sum_{\alpha} \omega_{\alpha}=$ $\sum_{A} \varepsilon_{A}\left(\omega_{A}\right)^{2}$, where $\left\{\omega_{1}, \ldots, \omega_{n=p}\right\}$ is the dual frame field of $\left\{e_{1}, \ldots, e_{n+p}\right\}, \varepsilon_{i}=1$ and $\varepsilon_{\alpha}=-1$. Here and in the following we shall use the following convention on the ranges of indices:

$$
1 \leq i, j, \cdots \leq n ; \quad n+1 \leq \alpha, \beta, \cdots \leq n+p ; \quad 1 \leq A, B, \cdots \leq n+p
$$

The structure equations of $R_{p}^{n+p}$ are given by

$$
\begin{aligned}
d e_{A} & =-\sum_{B} \varepsilon_{A} \omega_{A B} e_{B}, \\
d \omega_{A} & =-\sum_{B} \omega_{A B} \wedge \omega_{B}, \quad \omega_{A B}+\omega_{B A}=0 \\
d \omega_{A B} & =-\sum_{C} \varepsilon_{C} \omega_{A C} \wedge \omega_{C B} .
\end{aligned}
$$

Let $G_{n, p}^{p}$ be the pseudo-Grassmannian of all spacelike $n$-subspace in $R_{p}^{n+p}$, and $\widetilde{G_{n, p}^{p}}$ be the pseudo-Grassmannian of all timelike $p$-subspace in $R_{p}^{n+p}$. They are specific Cartan-Hadamard manifolds, and the canonical Riemannian metric on $G_{n, p}^{p}$ and $\widetilde{G_{n, p}^{p}}$ is

$$
d s_{G}=d s_{\widetilde{G}}=\sum_{i \alpha}\left(\omega_{\alpha i}\right)^{2}
$$

Let 0 be the origin of $R_{p}^{n+p}$. Let $S O^{0}(n+p, p)$ denote the identity component of the Lorentzian group $O(n+p, p) . S O^{0}(n+p, p)$ can be viewed as the manifold consisting of all pseudo-Euclidean frames $\left(0 ; e_{i}, e_{\alpha}\right)$, and $S O^{0}(n+p, p) / S O(n) \times$ $S O(p)$ can be viewed as $G_{n, p}^{p}$ or $\widetilde{G_{n, p}^{p}}$. Any element in $G_{n, p}^{p}$ can be represented by a unit simple $n$-vector $e_{1} \wedge \cdots \wedge e_{n}$, while any element in $\widetilde{G_{n, p}^{p}}$ can be represented by a unit simple $p$-vector $e_{n+1} \wedge \cdots \wedge e_{n+p}$. They are unique up to an action of $S O(n) \times S O(p)$. The Hodge star $*$ provides an one to one correspondence between $G_{n, p}^{p}$ and $\widetilde{G_{n, p}^{p}}$. The product $\langle$,$\rangle on G_{n, p}^{p}$ for $e_{1} \wedge \cdots \wedge e_{n}, v_{1} \wedge \cdots \wedge v_{n}$ is defined by

$$
\left\langle e_{1} \wedge \cdots \wedge e_{n}, v_{1} \wedge \cdots \wedge v_{n}\right\rangle=\operatorname{det}\left(\left\langle e_{i}, v_{j}\right\rangle\right) .
$$

The product on $\widetilde{G_{n, p}^{p}}$ can be defined similarly.
Now we fix a standard pseudo-Euclidean frame $e_{i}, e_{\alpha}$ for $R_{p}^{n+p}$, and take $g_{0}=$ $e_{1} \wedge \cdots \wedge e_{n} \in G_{n, p}^{p}, \widetilde{g_{0}}=* g_{0}=e_{n+1} \wedge \cdots \wedge e_{n+p} \in \widetilde{G_{n, p}^{p}}$. Then we can span the
spacelike $n$-subspace $g$ in a neighborhood of $g_{0}$ by $n$ spacelike vectors $f_{i}$ :

$$
f_{i}=e_{i}+\sum_{\alpha} z_{i \alpha} e_{\alpha}
$$

where $\left(z_{i \alpha}\right)$ are the local coordinates of $g$. By an action of $S O(n) \times S O(p)$ we can assume that

$$
\left(z_{i \alpha}\right)=\left(\begin{array}{ccc}
\mu_{1} & & \\
& \ddots & \\
& & \mu_{p} \\
& 0 &
\end{array}\right)
$$

From [3] we know that the normal geodesic $g(t)$ between $g_{0}$ and $g$ has local coordinates

$$
\left(z_{i \alpha}\right)=\left(\begin{array}{ccc}
\tanh \left(\lambda_{1} t\right) & & \\
& \ddots & \\
& & \tanh \left(\lambda_{p} t\right)
\end{array}\right)
$$

for real numbers $\lambda_{1} \ldots \lambda_{p}$ such that $\sum_{i=1}^{p} \lambda_{i}^{2}=1$. This means that $g(t)$ is spanned by $f_{1}(t)=e_{1}+\tanh \left(\lambda_{1} t\right) e_{n+1}, \ldots, f_{p}(t)=e_{p}+\tanh \left(\lambda_{p} t\right) e_{n+p}, f_{p+1}=e_{p+1}, \ldots, f_{n}=$ $e_{n}$. Consequently, $g(t)$ can also be represented by a unit simple $n$-vector as following:

$$
\begin{aligned}
g(t)= & \left(\cosh \left(\lambda_{1} t\right) e_{1}+\sinh \left(\lambda_{1} t\right) e_{n+1}\right) \wedge \cdots \wedge\left(\cosh \left(\lambda_{p} t\right) e_{1}\right. \\
& \left.+\sinh \left(\lambda_{p} t\right) e_{n+p}\right) \wedge e_{p+1} \wedge \cdots \wedge e_{n} .
\end{aligned}
$$

Set $\lambda_{\alpha}=\lambda_{\alpha-n}$, then it is clear that

$$
\begin{aligned}
& \cosh \left(\lambda_{1} t\right) e_{1}+\sinh \left(\lambda_{1} t\right) e_{n+1}, \ldots, \cosh \left(\lambda_{p} t\right) e_{1}+\sinh \left(\lambda_{p} t\right) e_{n+p}, e_{p+1}, \ldots, e_{n} \\
& \sinh \left(\lambda_{n+1} t\right) e_{1}+\cosh \left(\lambda_{n+1} t\right) e_{n+1}, \ldots, \sinh \left(\lambda_{n+p} t\right) e_{p}+\cosh \left(\lambda_{n+p} t\right) e_{n+p}
\end{aligned}
$$

is again a pseudo-Euclidean frame for $R_{p}^{n+p}$, so we have

$$
\begin{aligned}
\widetilde{g(t)}=* g(t)= & \left(\sinh \left(\lambda_{n+1} t\right) e_{1}+\cosh \left(\lambda_{n+1} t\right) e_{n+1}\right) \wedge \cdots \wedge\left(\sinh \left(\lambda_{n+p} t\right) e_{p}\right. \\
& \left.+\cosh \left(\lambda_{n+p} t\right) e_{n+p}\right) \in \widetilde{G_{n, p}^{p}}
\end{aligned}
$$

Thus we have

$$
\left\langle g_{0}, g\right\rangle=(-1)^{p}\left\langle * g_{0}, * g\right\rangle=(-1)^{p}\left\langle\widetilde{g_{0}}, \tilde{g}\right\rangle=\prod_{\alpha} \cosh \left(\lambda_{\alpha} t\right) .
$$

In this note, we also need the following lemma,
Lemma 2.1 ([4]). Let $\mu_{1} \geq 1, \ldots, \mu_{p} \geq 1$ and $\prod_{\alpha} \mu_{\alpha}=C$. Then $\sum_{\alpha} \cosh ^{2}\left(\lambda_{\alpha}\right) \leq$ $C^{2}+p-1$, and the equality holds if and only if $\mu_{i_{0}}=C$ for some $1 \leq i_{0} \leq p$ and $\mu_{i}=1$ for any $i \neq i_{0}$.

## 3. Main results for space-Like submanifolds

In this note, we get the following result:
Theorem 3.1. Let $M^{n}$ be a complete space-like submanifold in $R_{p}^{n+p}$ whose Gauss map is bounded, then we have $\lambda_{1}(M)=0$.

Proof. We choose a local frames $e_{1} \ldots, e_{n+p}$ in $R_{p}^{n+p}$ such that restricted to $M^{n}$, $e_{1}, \ldots, e_{n}$ are tangent to $M^{n}, e_{n+1}, \ldots, e_{n+p}$ are normal to $M^{n}$, the Gauss map is defined by $e_{n+1} \wedge \cdots \wedge e_{n+p}: M^{n} \rightarrow \widetilde{G_{n, p}^{p}}$. Let us fix $p$-vector and $n$-vector $a_{n+1} \wedge \cdots \wedge a_{n+p} \in \widetilde{G_{n, p}^{p}}, a_{1} \wedge \cdots \wedge a_{n} \in G_{n, p}^{p}$, where $\left\langle a_{\alpha}, a_{\beta}\right\rangle=-\delta_{\alpha \beta}$ and $\left\langle a_{i}, a_{j}\right\rangle=\delta_{i j}$. We defined the projection $\Pi: M^{n} \rightarrow R_{a}^{n}$ by

$$
\begin{equation*}
\Pi(x)=x+\sum_{\alpha=n+1}^{n+p}\left\langle x, a_{\alpha}\right\rangle a_{\alpha}, \tag{1}
\end{equation*}
$$

where $\langle$,$\rangle is the standard indefinite inner product on R_{p}^{n+p}$ and $R_{a}^{n}$ the totally geodesic Euclidean $n$-space determined by $a=a_{n+1} \wedge \cdots \wedge a_{n+p}$ which is defined by

$$
\begin{equation*}
R_{a}^{n}=\left\{x \in R_{p}^{n+p}:\left\langle x, a_{n+1}\right\rangle=\cdots=\left\langle x, a_{n+p}\right\rangle=0\right\} . \tag{2}
\end{equation*}
$$

It is clear from (1) that

$$
\begin{equation*}
\mathrm{d} \Pi(X)=X+\sum_{\alpha=n+1}^{n+p}\left\langle X, a_{\alpha}\right\rangle a_{\alpha} \tag{3}
\end{equation*}
$$

for any tangent vector field on $M^{n}$ and consequently,

$$
\begin{equation*}
|\mathrm{d} \Pi(X)|^{2}=|X|^{2}+\sum_{\alpha=n+1}^{n+p}\left\langle X, a_{\alpha}\right\rangle^{2} \tag{4}
\end{equation*}
$$

From the equation (4), we know that the map $\Pi: M^{n} \rightarrow R_{a}^{n}$ increases the distance. If a map, from a complete Riemannian manifold $M_{1}$ into another Riemannian manifold $M_{2}$ of same dimension, increases the distance, then it is a covering map and $M_{2}$ is complete (in [2, VIII, Lemma 8.1]). Hence $\Pi$ is a covering map, but $R_{a}^{n}$ being simply connected this means that $\Pi$ is in face a diffeomorphism between $M^{n}$ and $R_{a}^{n}$, and thus $M^{n}$ is noncompact. Now assume that the Gauss map $e_{n+1} \wedge \cdots \wedge e_{n+p}: M^{n} \rightarrow \widetilde{G_{n, p}^{p}}$ is bounded, then there exists $\rho>0$ such that

$$
\begin{equation*}
1 \leq(-1)^{p}\left\langle e_{n+1} \wedge \cdots \wedge e_{n+p}, a_{n+1} \wedge \cdots \wedge a_{n+p}\right\rangle \leq \rho \tag{5}
\end{equation*}
$$

From Section 2 we know that by an action of $S O(n) \times S O(p)$ we can assume that

$$
\begin{aligned}
e_{n+1} & =\sinh \left(\lambda_{n+1} t\right) a_{1}+\cosh \left(\lambda_{n+1} t\right) a_{n+1}, \ldots, e_{n+p} \\
& =\sinh \left(\lambda_{n+p} t\right) a_{1}+\cosh \left(\lambda_{n+p} t\right) a_{n+p}
\end{aligned}
$$

where $\sum_{\alpha} \lambda_{\alpha}^{2}=1$ and $t \in R$.

Write

$$
\begin{equation*}
a_{\alpha}=a^{\top}-\sum_{\beta=n+1}^{n+p}\left\langle a_{\alpha}, e_{\beta}\right\rangle e_{\beta} \tag{6}
\end{equation*}
$$

where $a_{\alpha}^{\top}$ denote the component of $a_{\alpha}$ which is tangent to $M^{n}$, and $\alpha=n+$ $1, \ldots, n+p$. Since $\left\langle a_{\alpha}, a_{\beta}\right\rangle=-\delta_{\alpha \beta}$, we have

$$
\begin{equation*}
-1=\left|a_{\alpha}^{\top}\right|^{2}-\sum_{\beta=n+1}^{n+p}\left\langle a_{\alpha}, e_{\beta}\right\rangle^{2}=\left|a_{\alpha}^{\top}\right|^{2}-\cosh ^{2}\left(\lambda_{\alpha} t\right) \tag{7}
\end{equation*}
$$

where $\alpha=n+1, \ldots, n+p$. It follows from Lemma 2.1 and Eq. (5), (7), we have

$$
\begin{equation*}
1+\sum_{\alpha=n+1}^{n+p}\left|a_{\alpha}^{\top}\right|^{2}=\sum_{\alpha=n+1}^{n+p} \cosh ^{2}\left(\lambda_{\alpha} t\right)-p+1 \leq \prod \cosh ^{2}\left(\lambda_{\alpha} t\right) \leq \rho^{2} \tag{8}
\end{equation*}
$$

From Eq. (4) and (8), we have

$$
\begin{equation*}
|\mathrm{d} \Pi(X)|^{2}=|X|^{2}+\sum_{\alpha=n+1}^{n+p}\left\langle X, a_{\alpha}^{\top}\right\rangle^{2} \leq|X|^{2}\left(1+\sum_{\alpha=n+1}^{n+p}\left|a_{\alpha}^{\top}\right|^{2}\right) \leq \rho^{2}|X|^{2} \tag{9}
\end{equation*}
$$

for any tangent vector field on $M^{n}$. Let $B(p, r)$ is the geodesic ball of $M^{n}$ with radius $r$ centered at $p \in M^{n}$. We claim that $\Pi(B(p, r)) \subset \widetilde{B}(\widetilde{p}, \rho r)$, where $\widetilde{B}(\widetilde{p}, \rho r)$ denotes the geodesic ball of $R_{a}^{n}$ with radius $\rho r$ centered at $\widetilde{p}=\Pi(p)$. In fact, for any $\widetilde{q} \in \Pi(B(p, r))$ let $q \in B(p, r)$ be the unique point such that $\Pi(q)=\widetilde{q}$, and $\gamma:[a, b] \rightarrow M^{n}$ is the minimal geodesic joining $p$ and $q$, then from (9) we have

$$
\widetilde{d}(\widetilde{p}, \widetilde{q}) \leq L(\Pi \circ r)=\int_{a}^{b}\left|\mathrm{~d} \Pi\left(\gamma^{\prime}(t)\right)\right| d t \leq \rho \int_{a}^{b}\left|\gamma^{\prime}(t)\right| d t=\rho L(\gamma)=\rho d(p, q) \leq \rho r
$$

where $\tilde{d}$ and $d$ denote the distance in $R_{a}^{n}$ and $M^{n}$, respectively. This prove our claim.

Let $d V$ denotes the $n$-dimensional volume element on $R_{a}^{n}$. Using (3) and (6) it follows that

$$
\begin{aligned}
\Pi^{*}(d V)\left(X_{1}, \ldots, X_{n}\right)= & \operatorname{det}\left(\operatorname{d} \Pi\left(X_{1}\right), \ldots, \mathrm{d} \Pi\left(X_{n}\right), a_{n+1}, \ldots, a_{n+p}\right) \\
= & \operatorname{det}\left(X_{1}, \ldots, X_{n}, a_{n+1}, \ldots, a_{n+p}\right) \\
= & (-1)^{p}\left\langle e_{n+1} \wedge \cdots \wedge e_{n+p}, a_{n+1} \wedge \cdots \wedge a_{n+p}\right\rangle \\
& \operatorname{det}\left(X_{1}, \ldots, X_{n}, e_{n+1}, \ldots, e_{n+p}\right) \\
= & (-1)^{p}\left\langle e_{n+1} \wedge \cdots \wedge e_{n+p}, a_{n+1} \wedge \cdots \wedge a_{n+p}\right\rangle \\
& d M\left(X_{1}, \ldots, X_{n}\right)
\end{aligned}
$$

for any tangent vector fields $X_{1}, \ldots, X_{n}$ of $M^{n}$. In other words,

$$
\begin{equation*}
\Pi^{*}(d V)=(-1)^{p}\left\langle e_{n+1} \wedge \cdots \wedge e_{n+p}, a_{n+1} \wedge \cdots \wedge a_{n+p}\right\rangle d M \geq d M \tag{10}
\end{equation*}
$$

Since $\Pi(B(p, r)) \subset \widetilde{B}(\widetilde{p}, \rho r)$ and $\Pi: M^{n} \rightarrow R_{a}^{n}$ is diffeomorphism, it follows from Eq. (10) that

$$
\begin{align*}
\rho^{n} r^{n} \omega_{n} & =\operatorname{Vol}(\widetilde{B}(\widetilde{p}, \rho r)) \geq \operatorname{Vol}(\Pi(B(p, r)))=\int_{\Pi(B(p, r))} d V \\
& =\int_{B(p, r)} \Pi^{*} d V \geq \int_{B(p, r)} d M=\operatorname{Vol}(B(p, r)), \tag{11}
\end{align*}
$$

where $\omega_{n}$ denotes the volume of unit ball in Euclidean $n$-space. (11) means that the order of the volume growth of $M^{n}$ is not larger than $n$, thus by [1] we see that $\lambda_{1}(M)=0$.
