# PERIODIC SOLUTIONS FOR A CLASS OF NON-AUTONOMOUS HAMILTONIAN SYSTEMS WITH $p(t)$-LAPLACIAN 

Zhiyong Wang, Zhengya Qian, Nanjing

Received June 3, 2022. Published online March 28, 2023.
Communicated by Ondřej Kreml

Abstract. We investigate the existence of infinitely many periodic solutions for the $p(t)-$ Laplacian Hamiltonian systems. By virtue of several auxiliary functions, we obtain a series of new super- $p^{+}$growth and asymptotic- $p^{+}$growth conditions. Using the minimax methods in critical point theory, some multiplicity theorems are established, which unify and generalize some known results in the literature. Meanwhile, we also present an example to illustrate our main results are new even in the case $p(t) \equiv p=2$.

Keywords: auxiliary functions; $p(t)$-Laplacian systems; periodic solution; (C) condition; generalized mountain pass theorem

MSC 2020: 34C25, 35A15

## 1. Introduction and main results

Consider the $p(t)$-Laplacian systems

$$
\begin{equation*}
-\left(\left|u^{\prime}(t)\right|^{p(t)-2} u^{\prime}(t)\right)^{\prime}=\nabla F(t, u(t)) \quad \text { a.e. } t \in \mathbb{R} \tag{1.1}
\end{equation*}
$$

where $F(t, x)$ and $p(t)$ satisfy the following conditions:
(H0) $F:[0, T] \times \mathbb{R}^{\mathbb{N}} \rightarrow \mathbb{R}$ is measurable and $T$-periodic $(T>0)$ in its first variable
for all $x \in \mathbb{R}^{\mathbb{N}}$, continuously differentiable in $x$ for a.e. $t \in[0, T]$, and there exist $a \in C\left(\mathbb{R}^{+}, \mathbb{R}^{+}\right), b \in L^{1}\left(0, T ; \mathbb{R}^{+}\right)$such that

$$
|F(t, x)|+|\nabla F(t, x)| \leqslant a(|x|) b(t)
$$

for all $x \in \mathbb{R}^{\mathbb{N}}$ and a.e. $t \in[0, T]$;
This work is partially supported by the National Natural Science Foundation of China (11571176, 11701289) and Jiangsu Province Science Foundation for Youths (BK20170936).
(P) $p(t) \in C\left(0, T ; \mathbb{R}^{+}\right), p(t)=p(t+T)$ and

$$
1<p^{-}:=\min _{0 \leqslant t \leqslant T} p(t) \leqslant p^{+}:=\max _{0 \leqslant t \leqslant T} p(t)<\infty .
$$

The interest in the study of problem (1.1) is twofold. On one hand, we have the physical motivations, since the $p(t)$-Laplacian systems can be applied to describe the physical phenomena with 'pointwise different properties' which first arose from the nonlinear elasticity theory, see [31] and the references therein. On the other hand, we have the purely mathematical interest in these types of problems, mainly regarding the existence of solutions as well as multiplicity results. For more general and recent works on $p(t)$-Laplacian systems, we refer the reader to [4], [10], [22], [26], [28].

As we have seen, if $p(t) \equiv p>1$, problem (1.1) reduces to the classical ordinary $p$-Laplacian systems

$$
\begin{equation*}
-\left(\left|u^{\prime}(t)\right|^{p-2} u^{\prime}(t)\right)^{\prime}=\nabla F(t, u(t)) \quad \text { a.e. } t \in \mathbb{R} \tag{1.2}
\end{equation*}
$$

In last decades, considerable attention has been drawn to the existence and multiplicity of periodic solutions for problem (1.2) under various conditions, see [8], [9], [11], [21], [25], [27], [30]. Specially, applying the generalized mountain pass theorem and some techniques of analysis, Ma and Zhang in [11] have proved problem (1.2) has infinitely many nontrivial periodic solutions. More precisely, for the super- $p$ growth case, they established the following theorem.

Theorem 1.1 ([11]). Assume that $F$ satisfies (H0) and the following conditions:
(H1) $F(t, x) \geqslant 0$ for all $(t, x) \in[0, T] \times \mathbb{R}^{\mathbb{N}}$;
(H2) $\lim _{|x| \rightarrow 0} F(t, x) /|x|^{p}=0$ uniformly for a.e. $t \in[0, T]$;
(H3) $\liminf _{|x| \rightarrow \infty} F(t, x) /|x|^{p}>0$ uniformly for a.e. $t \in[0, T]$;
(H4) $\lim \sup F(t, x) /|x|^{r} \leqslant M<\infty$ uniformly for some $M>0$ and a.e. $t \in[0, T]$;
(H5) $\liminf _{|x| \rightarrow \infty}((\nabla F(t, x), x)-p F(t, x)) /|x|^{\mu} \geqslant \varrho>0$ uniformly for some $\varrho>0$ and a.e. $t \in[0, T]$,
where $r>p, \mu>r-p$ and $(\cdot, \cdot),|\cdot|$ are the Euclidean inner product and norm in $\mathbb{R}^{\mathbb{N}}$, respectively. Then problem (1.2) has a sequence of distinct periodic solutions with period $k_{j} T$ satisfying $k_{j} \in \mathbb{N}$ and $k_{j} \rightarrow \infty$ as $j \rightarrow \infty$.

At the same time, for the asymptotic- $p$ growth case, they obtained the following results.

Theorem 1.2 ([11]). Assume that $F$ satisfies (H0)-(H3) and the following conditions:
( $\mathrm{H} 4^{\prime}$ ) $\limsup _{|x| \rightarrow \infty} F(t, x) /|x|^{p} \leqslant M<\infty$ uniformly for some $M>0$ and a.e. $t \in[0, T]$;
(H6) there exists $\gamma \in L^{1}\left(0, T ; \mathbb{R}^{+}\right)$such that $(\nabla F(t, x), x)-p F(t, x) \geqslant \gamma(t)$ for all $x \in \mathbb{R}^{\mathbb{N}}$ and a.e. $t \in[0, T] ;$
(H7) $\lim _{|x| \rightarrow \infty}((\nabla F(t, x), x)-p F(t, x))=\infty$ uniformly for a.e. $t \in[0, T]$.
Then problem (1.2) has a sequence of distinct periodic solutions with period $k_{j} T$ satisfying $k_{j} \in \mathbb{N}$ and $k_{j} \rightarrow \infty$ as $j \rightarrow \infty$.

Theorem 1.3 ([11]). Assume that $F$ satisfies (H0)-(H3), (H4') and the following conditions:
$\left(\mathrm{H}^{\prime}\right)$ there exists $\gamma \in L^{1}\left(0, T ; \mathbb{R}^{+}\right)$such that $(\nabla F(t, x), x)-p F(t, x) \leqslant \gamma(t)$ for all $x \in \mathbb{R}^{\mathbb{N}}$ and a.e. $t \in[0, T] ;$
$\left(H 7^{\prime}\right) \lim _{|x| \rightarrow \infty}((\nabla F(t, x), x)-p F(t, x))=-\infty$ uniformly for a.e. $t \in[0, T]$.
Then problem (1.2) has a sequence of distinct periodic solutions with period $k_{j} T$ satisfying $k_{j} \in \mathbb{N}$ and $k_{j} \rightarrow \infty$ as $j \rightarrow \infty$.

Motivated by the results of [6], [11], [19], [20], [23], [24], in the present paper, making use of auxiliary functions, we are interested in extending Theorem 1.1 to the $p(t)$-Laplacian systems (1.1) under more general hypotheses. In addition, we should stress that the different methods in [11] are used to ensure the compact conditions for the super- $p$ growth situation and the asymptotic- $p$ growth situation. Here, we attempt to propose a unified approach when the potential function $F(t, x)$ exhibits either an asymptotic- $p^{+}$or a super- $p^{+}$behaviour for problem (1.1). Hence, our results are new and improve recent results in the literature even in the case $p(t) \equiv p=2$.

Now, we are in a position to state our main results. To begin with, for the super- $p^{+}$ growth case, we have:

Theorem 1.4. Suppose that conditions (H0), (P) hold and $F$ satisfies the following conditions:
(F1) $F(t, x) \geqslant 0$ for all $(t, x) \in[0, T] \times \mathbb{R}^{\mathbb{N}}$;
(F2) $\lim _{|x| \rightarrow 0} F(t, x) /|x|^{p^{+}}=0$ uniformly for a.e. $t \in[0, T]$;
(F3) $\liminf _{|x| \rightarrow \infty} F(t, x) /|x|^{p^{+}}>0$ uniformly for a.e. $t \in[0, T]$;
(F4) there exists $h \in C\left(\mathbb{R}^{+}, \mathbb{R}^{+}\right)$such that
$\limsup _{|x| \rightarrow \infty} \frac{F(t, x)}{h(|x|)} \leqslant M<\infty$ uniformly for some $M>0$ and a.e. $t \in[0, T] ;$
(F5) there exist $M_{1}>0, \theta_{1} \in C\left(\mathbb{R}^{+}, \mathbb{R}^{+}\right)$with $\lim _{s \rightarrow \infty} h(s) / \theta_{1}(s) s^{p^{-}}=0$ and $\theta_{1}(s) / h(s)$ is non-increasing in $s$ for all $s \in \mathbb{R}^{+}$, where $h(s)$ is defined in (F4), such that

$$
(\nabla F(t, x), x)-p^{+} F(t, x) \geqslant \theta_{1}(|x|) \quad \forall x \in \mathbb{R}^{\mathbb{N}},|x| \geqslant M_{1} \text { and for a.e. } t \in[0, T] .
$$

Then problem (1.1) has a sequence of distinct periodic solutions with period $k_{j} T$ satisfying $k_{j} \in \mathbb{N}$ and $k_{j} \rightarrow \infty$ as $j \rightarrow \infty$.

Remark 1.5. When comparing Theorem 1.4 to Theorem 1.1, the following four aspects must be pointed out:
(1) Condition (F1) is the same as (H1), conditions (F2) and (F3) can be regarded as natural generalizations of $(\mathrm{H} 2)$ and $(\mathrm{H} 3)$ about $p(t)$-Laplacian systems, respectively.
(2) We can find that conditions (F4) and (F5) cover the cases of assumptions (H4) and (H5) when (H1) (or (F1)) holds. We follow two steps to demonstrate this claim.

Step 1. We confirm that (H1) (or (F1)), (H4) and (H5) could imply $\mu \leqslant r$. It follows from (H4) that there exists $d_{1}>0$ such that

$$
\begin{equation*}
F(t, x) \leqslant M|x|^{r} \quad \forall x \in \mathbb{R}^{\mathbb{N}},|x| \geqslant d_{1} \text { and for a.e. } t \in[0, T] . \tag{1.3}
\end{equation*}
$$

By (H5), we can choose $d_{2}>0$ such that

$$
\begin{equation*}
(\nabla F(t, x), x)-p F(t, x) \geqslant \varrho|x|^{\mu} \quad \forall x \in \mathbb{R}^{\mathbb{N}},|x| \geqslant d_{2} \text { and for a.e. } t \in[0, T] . \tag{1.4}
\end{equation*}
$$

Let $d_{3}:=\max \left\{d_{1}, d_{2}\right\}$, taking account of (1.3), (1.4) and (H1) (or (F1)), we infer that

$$
\begin{aligned}
M|x|^{r} & \geqslant F(t, x)=\int_{0}^{1} \frac{1}{s}(\nabla F(t, s x), s x) \mathrm{d} s+F(t, 0) \geqslant \int_{0}^{1} \frac{1}{s}\left(\varrho|s x|^{\mu}+p F(t, s x)\right) \mathrm{d} s \\
& \geqslant \frac{1}{\mu} \varrho|x|^{\mu} \quad \forall x \in \mathbb{R}^{\mathbb{N}},|x| \geqslant d_{3} \text { and for a.e. } t \in[0, T]
\end{aligned}
$$

which implies that $\mu \leqslant r$.
Step 2. We claim that (H4) and (H5) are special cases of (F4) and (F5), respectively, when (H1) (or (F1)) holds. We only need to take $p(t) \equiv p>1, h(s)=s^{r}$, $\theta_{1}(s)=\varrho s^{\mu}$ and $M_{1}$ large enough, where $\varrho>0, r>p, \mu>r-p$. In fact, we can check that $\lim _{s \rightarrow \infty} h(s) / \theta_{1}(s) s^{p}=\lim _{s \rightarrow \infty} s^{r-\mu-p} / \varrho=0$ by $\mu>r-p$. Furthermore, $\theta_{1}(s) / h(s)=\varrho s^{\mu-r}$ is non-increasing in $s$ for all $s \in \mathbb{R}^{+}$by Step 1. Therefore, $h(s)$ and $\theta_{1}(s)$ satisfy all conditions of (F4) and (F5).
(3) There exist functions $F(t, x)$ satisfying Theorem 1.4 and not fulfilling the result of Theorem 1.1. The detailed example will be given in Section 5.
(4) Last but not the least, from the discussions of (1)-(3) we see that Theorem 1.4 significantly extends and improves Theorem 1.1.

Remark 1.6. In [23], the first author and Zhang are concerned with the existence of periodic solutions for the following damped vibration problem

$$
\left\{\begin{array}{l}
\ddot{u}(t)+q(t) \dot{u}+\nabla F(t, u(t))=0 \quad \text { a.e. } t \in[0, T]  \tag{1.5}\\
u(0)-u(T)=\dot{u}(0)-\dot{u}(T)=0
\end{array}\right.
$$

where $q \in L^{1}(0, T ; \mathbb{R}), \int_{0}^{T} q(t) \mathrm{d} t=0$. Theorem 1.1, the main result of [23], has introduced the following new non-quadratic conditions:
(F4*) $\limsup _{|x| \rightarrow \infty} \mathrm{e}^{Q(t)} F(t, x) /|x|^{r} \leqslant M<\infty$ uniformly for some $M>0$ and a.e. $t \in$ $[0, T]$, where $Q(t):=\int_{0}^{t} q(s) \mathrm{d} s, r>2 ;$
(F5 ${ }^{*}$ ) there exist $M_{1}>0, \mu>r-2$ and $k_{1} \in C\left(\mathbb{R}^{+}, \mathbb{R}^{+}\right)$with $\lim _{s \rightarrow \infty} k_{1}(s) s^{\mu+2-r}=\infty$, $\lim _{s \rightarrow \infty} k_{1}^{r / \mu}(s) s^{2}=\infty$ and $k_{1}(s)$ is non-increasing in $s$ for all $s \in \mathbb{R}^{+}$such that

$$
\begin{aligned}
\mathrm{e}^{Q(t)}((\nabla F(t, x), x)-2 F(t, x)) \geqslant k_{1}(|x|)|x|^{\mu} \quad \forall x \in \mathbb{R}^{\mathbb{N}},|x| \geqslant M_{1} \\
\quad \text { and for a.e. } t \in[0, T] .
\end{aligned}
$$

From [23] we have known that (F4*) and (F5*) are more general than (H4) and (H5) when (H1) (or (F1)) holds. Here, if $q(t) \equiv 0$ and $\mu \leqslant r$, we emphasize that these new non-quadratic conditions ( $\mathrm{F} 4^{*}$ ) and ( $\mathrm{F} 5^{*}$ ) are also special cases of assumptions (F4) and (F5), respectively. Indeed, set $p(t) \equiv p=2, h(s)=s^{r}$, $\theta_{1}(s)=k_{1}(s) s^{\mu}$. Using the properties of $k_{1}(s)$ and $\mu \leqslant r$, a direct computation shows that $\lim _{s \rightarrow \infty} h(s) / \theta_{1}(s) s^{2}=\lim _{s \rightarrow \infty} 1 / k_{1}(s) s^{\mu+2-r}=0$; moreover, we have $g(s):=\theta_{1}(s) / h(s)=k_{1}(s) s^{\mu-r}$ is non-increasing in $s$ for all $s \in \mathbb{R}^{+}$since $g(s) / g(t)=$ $\left(k_{1}(s) / k_{1}(t)\right)(s / t)^{\mu-r} \geqslant 1$ for all $s \leqslant t$ by $\mu \leqslant r$. Therefore, in some sense, Theorem 1.4 also generalizes Theorem 1.1 with $q(t) \equiv 0$ of [23].

Theorem 1.7. Suppose that conditions (H0), (P) hold, F satisfies (F1)-(F3) and the following condition:
(F6) there exist $M_{2}>0, \tau \geqslant 1, \theta_{2} \in C\left(\mathbb{R}^{+}, \mathbb{R}^{+}\right)$with $\lim _{s \rightarrow \infty} s^{p^{*}} / \theta_{2}^{1 / \tau}(s)=0$ and $\theta_{2}(s) / s^{p^{+} \tau}$ is non-increasing in $s$ for all $s \in \mathbb{R}^{+}$, where $p^{*}:=p^{+}-p^{-}$such that

$$
(\nabla F(t, x), x)-p^{+} F(t, x) \geqslant \theta_{2}(|x|)\left(\frac{F(t, x)}{|x|^{p^{+}}}\right)^{\tau} \quad \forall x \in \mathbb{R}^{\mathbb{N}},|x| \geqslant M_{2}
$$

and for a.e. $t \in[0, T]$.

Then problem (1.1) has a sequence of distinct periodic solutions with period $k_{j} T$ satisfying $k_{j} \in \mathbb{N}$ and $k_{j} \rightarrow \infty$ as $j \rightarrow \infty$.

Remark 1.8. We assert that (H1) (or (F1)), (H4) and (H5) could imply (F6) with $p(t) \equiv p>1$. As a matter of fact, in view of (H4) and (H5), for all $x \in \mathbb{R}^{\mathbb{N}}$ and $M_{2}$ large enough we have

$$
(\nabla F(t, x), x)-p F(t, x) \geqslant \varrho|x|^{\mu+p-r} \frac{|x|^{r}}{|x|^{p}} \geqslant \frac{\varrho}{M}|x|^{\mu+p-r} \frac{F(t, x)}{|x|^{p}} .
$$

Select $p(t) \equiv p, \tau=1, \theta_{2}(s)=\varrho s^{\mu+p-r} / M$, noticing $\mu>r-p$, then $\lim _{s \rightarrow \infty} 1 / \theta_{2}(s)=0$ and $\theta_{2}(s) / s^{p}=\varrho s^{\mu-r} / M$ is non-increasing in $s$ for all $s \in \mathbb{R}^{+}$by Remark 1.5 (2), Step 1. So, (F6) holds. Therefore, Theorem 1.7 greatly unifies and generalizes Theorem 1.1.

Theorem 1.9. Suppose that conditions (H0), (P) hold, F satisfies (F1)-(F3) and the following condition:
(F7) there exist $M_{3}>0, \sigma \geqslant p^{-} /\left(p^{-}-1\right), \theta_{3} \in C\left(\mathbb{R}^{+}, \mathbb{R}^{+}\right)$with $\lim _{s \rightarrow \infty} s^{p^{*}} / \theta_{3}^{1 / \sigma}(s)=0$ and $\theta_{3}(s) / s^{\left(p^{+}-1\right) \sigma}$ is non-increasing in $s$ for all $s \in \mathbb{R}^{+}$, such that

$$
\begin{aligned}
(\nabla F(t, x), x)-p^{+} F(t, x) \geqslant \theta_{3}(|x|)\left(\frac{|\nabla F(t, x)|}{|x|^{p^{+-1}}}\right)^{\sigma} \quad \forall x \in \mathbb{R}^{\mathbb{N}},|x| \geqslant M_{3} \\
\text { and for a.e. } t \in[0, T]
\end{aligned}
$$

Then problem (1.1) has a sequence of distinct periodic solutions with period $k_{j} T$ satisfying $k_{j} \in \mathbb{N}$ and $k_{j} \rightarrow \infty$ as $j \rightarrow \infty$.

Remark 1.10. When $p(t) \equiv p=2, \sigma>1$, condition (F7) was originally due to [24].

Next, turning our attention to the asymptotic- $p^{+}$growth case, from Theorem 1.4, Theorem 1.7 and Theorem 1.9, we can easily get the following results.

Corollary 1.11. Suppose that conditions (H0), (P) hold, F satisfies (F1)-(F3) and the following conditions:
(F4') $\limsup _{|x| \rightarrow \infty} F(t, x) /|x|^{p^{+}} \leqslant M<\infty$ uniformly for some $M>0$ and a.e. $t \in[0, T]$;
(F5') there exist $M_{1}>0, \theta_{1} \in C\left(\mathbb{R}^{+}, \mathbb{R}^{+}\right)$with $\lim _{s \rightarrow \infty} s^{p^{*}} / \theta_{1}(s)=0$ and $\theta_{1}(s) / s^{p^{+}}$is non-increasing in $s$ for all $s \in \mathbb{R}^{+}$such that

$$
(\nabla F(t, x), x)-p^{+} F(t, x) \geqslant \theta_{1}(|x|) \quad \forall x \in \mathbb{R}^{\mathbb{N}},|x| \geqslant M_{1} \text { and for a.e. } t \in[0, T] .
$$

Then problem (1.1) has a sequence of distinct periodic solutions with period $k_{j} T$ satisfying $k_{j} \in \mathbb{N}$ and $k_{j} \rightarrow \infty$ as $j \rightarrow \infty$.

Remark 1.12. Corollary 1.11 seems like a new result. When $p(t) \equiv p$, in contrast to Theorem 1.2, Corollary 1.11 removes the assumption (H6) completely although it uses a few stronger condition (F5') instead of (H7).

Corollary 1.13. Suppose that conditions (H0), (P) hold, F satisfies (F1)-(F3) and ( $\mathrm{F} 4^{\prime}$ ) and the following condition:
$\left(\mathrm{F} 5^{\prime \prime}\right)$ there exist $M_{1}>0, \theta_{1} \in C\left(\mathbb{R}^{+}, \mathbb{R}^{+}\right)$with $\lim _{s \rightarrow \infty} s^{p^{*}} / \theta_{1}(s)=0$ and $\theta_{1}(s) / s^{p^{+}}$is non-increasing in $s$ for all $s \in \mathbb{R}^{+}$such that

$$
(\nabla F(t, x), x)-p^{+} F(t, x) \leqslant-\theta_{1}(|x|) \quad \forall x \in \mathbb{R}^{\mathbb{N}},|x| \geqslant M_{1} \text { and for a.e. } t \in[0, T] .
$$

Then problem (1.1) has a sequence of distinct periodic solutions with period $k_{j} T$ satisfying $k_{j} \in \mathbb{N}$ and $k_{j} \rightarrow \infty$ as $j \rightarrow \infty$.

Corollary 1.14. Suppose that conditions (H0), (P) hold, F satisfies (F1)-(F3) and ( $\mathrm{F} 4^{\prime}$ ) and the following condition:
$\left(\mathrm{F}^{\prime}\right)$ there exist $M_{2}>0, \tau \geqslant 1, \theta_{2} \in C\left(\mathbb{R}^{+}, \mathbb{R}^{+}\right)$with $\lim _{s \rightarrow \infty} s^{p^{*}} / \theta_{2}^{1 / \tau}(s)=0$ and $\theta_{2}(s) / s^{p^{+} \tau}$ is non-increasing in $s$ for all $s \in \mathbb{R}^{+}$such that

$$
(\nabla F(t, x), x)-p^{+} F(t, x) \geqslant \theta_{2}(|x|) \quad \forall x \in \mathbb{R}^{\mathbb{N}},|x| \geqslant M_{2} \text { and for a.e. } t \in[0, T] .
$$

Then problem (1.1) has a sequence of distinct periodic solutions with period $k_{j} T$ satisfying $k_{j} \in \mathbb{N}$ and $k_{j} \rightarrow \infty$ as $j \rightarrow \infty$.

Corollary 1.15. Suppose that conditions (H0), (P) hold, F satisfies (F1)-(F3) and ( $\mathrm{F} 4^{\prime}$ ) and the following condition:
$\left(\mathrm{F}^{\prime \prime}\right)$ there exist $M_{2}>0, \tau \geqslant 1, \theta_{2} \in C\left(\mathbb{R}^{+}, \mathbb{R}^{+}\right)$with $\lim _{s \rightarrow \infty} s^{p^{*}} / \theta_{2}^{1 / \tau}(s)=0$ and $\theta_{2}(s) / s^{p^{+} \tau}$ is non-increasing in $s$ for all $s \in \mathbb{R}^{+}$such that

$$
(\nabla F(t, x), x)-p^{+} F(t, x) \leqslant-\theta_{2}(|x|) \quad \forall x \in \mathbb{R}^{\mathbb{N}},|x| \geqslant M_{2} \text { and for a.e. } t \in[0, T] .
$$

Then problem (1.1) has a sequence of distinct periodic solutions with period $k_{j} T$ satisfying $k_{j} \in \mathbb{N}$ and $k_{j} \rightarrow \infty$ as $j \rightarrow \infty$.

Corollary 1.16. Suppose that conditions (H0), (P) hold, F satisfies (F1)-(F3) and the following conditions:
(F4') $\limsup _{|x| \rightarrow \infty}|\nabla F(t, x)| /|x|^{p^{+}-1} \leqslant M<\infty$ uniformly for a.e. $t \in[0, T]$;
(F7') there exist $M_{3}>0, \sigma \geqslant p^{-} /\left(p^{-}-1\right)$, $\theta_{3} \in C\left(\mathbb{R}^{+}, \mathbb{R}^{+}\right)$with $\lim _{s \rightarrow \infty} s^{p^{*}} /$ $\theta_{3}^{1 / \sigma}(s)=0$ and $\theta_{3}(s) / s^{\left(p^{+}-1\right) \sigma}$ is non-increasing in $s$ for all $s \in \mathbb{R}^{+}$such that $(\nabla F(t, x), x)-p^{+} F(t, x) \geqslant \theta_{3}(|x|) \quad \forall x \in \mathbb{R}^{\mathbb{N}},|x| \geqslant M_{3}$ and for a.e. $t \in[0, T]$.

Then problem (1.1) has a sequence of distinct periodic solutions with period $k_{j} T$ satisfying $k_{j} \in \mathbb{N}$ and $k_{j} \rightarrow \infty$ as $j \rightarrow \infty$.

Corollary 1.17. Suppose that conditions (H0), (P) hold, F satisfies (F1), (F2) and ( $\mathrm{F} 4^{\prime \prime}$ ) and the following conditions:
(F3') $\liminf _{|x| \rightarrow \infty}(\nabla F(t, x), x) /|x|^{p^{+}}>0$ uniformly for a.e. $t \in[0, T]$;
$\left(\mathrm{F}^{\prime \prime}\right)$ there exist $M_{3}>0, \sigma \geqslant p^{-} /\left(p^{-}-1\right)$, $\theta_{3} \in C\left(\mathbb{R}^{+}, \mathbb{R}^{+}\right)$with $\lim _{s \rightarrow \infty} s^{p^{*}} /$ $\theta_{3}^{1 / \sigma}(s)=0$ and $\theta_{3}(s) / s^{\left(p^{+}-1\right) \sigma}$ is non-increasing in $s$ for all $s \in \mathbb{R}^{+}$such that
$(\nabla F(t, x), x)-p^{+} F(t, x) \leqslant-\theta_{3}(|x|) \quad \forall x \in \mathbb{R}^{\mathbb{N}},|x| \geqslant M_{3}$ and for a.e. $t \in[0, T]$.
Then problem (1.1) has a sequence of distinct periodic solutions with period $k_{j} T$ satisfying $k_{j} \in \mathbb{N}$ and $k_{j} \rightarrow \infty$ as $j \rightarrow \infty$.

Remark 1.18. Without loss of generality, we may assume that function $b$ in assumption (H0) is $T$-periodic.

Finally, the rest of this paper is organized as follows. In Section 2, we set up the functional analytic framework needed to study problem (1.1) from the variational point of view. In Section 3, we find that all (C) sequences (see Definition 3.2 below) of the energy functional associated with systems (1.1) are bounded (see Lemmas 3.3-3.5 below), then we prove all the compact conditions (C) (see Definition 3.2 below) hold. In Section 4, we adopt the same ideas developed by Ma and Zhang in [11] to show our main results by generalized mountain pass theorem in [12]. At last, in Section 5, we give an example to illustrate our results are new even in the case $p(t) \equiv p=2$.

## 2. Preliminaries

In this section, we first give some necessary background knowledge and propositions concerning the generalized Lebesgue-Sobolev spaces. We can refer the reader to [3] for more information.

Let $k$ be a positive integer and $p(t)$ satisfy condition (P). Define

$$
L^{p(t)}\left(0, k T ; \mathbb{R}^{\mathbb{N}}\right):=\left\{u \in L^{1}\left(0, k T ; \mathbb{R}^{\mathbb{N}}\right): \int_{0}^{k T}|u|^{p(t)} \mathrm{d} t<\infty\right\}
$$

with the norm

$$
|u|_{L^{p(t)}}=|u|_{p(t)}:=\inf \left\{\lambda>0: \int_{0}^{k T}\left|\frac{u}{\lambda}\right|^{p(t)} \mathrm{d} t \leqslant 1\right\} .
$$

Define

$$
C_{k T}^{\infty}=C_{k T}^{\infty}\left(\mathbb{R} ; \mathbb{R}^{\mathbb{N}}\right):=\left\{u \in C^{\infty}\left(\mathbb{R} ; \mathbb{R}^{\mathbb{N}}\right): u \text { is } k T \text {-periodic }\right\} .
$$

For $u \in L^{1}\left(0, k T ; \mathbb{R}^{\mathbb{N}}\right)$, if there exists $\nu \in L^{1}\left(0, k T ; \mathbb{R}^{\mathbb{N}}\right)$ satisfying

$$
\int_{0}^{k T} \nu \varphi \mathrm{~d} t=-\int_{0}^{k T} u \varphi^{\prime} \mathrm{d} t \quad \forall \varphi \in C_{k T}^{\infty}
$$

then $\nu$ is called the $k T$-weak derivative of $u$ and is denoted by $u^{\prime}$. Define

$$
W_{k T}^{1, p(t)}\left(0, k T ; \mathbb{R}^{\mathbb{N}}\right):=\left\{u \in L^{p(t)}\left(0, k T ; \mathbb{R}^{\mathbb{N}}\right): u^{\prime} \in L^{p(t)}\left(0, k T ; \mathbb{R}^{\mathbb{N}}\right)\right\}
$$

with the norm

$$
\|u\|_{W_{k T}^{1, p(t)}}=\|u\|:=|u|_{p(t)}+\left|u^{\prime}\right|_{p(t)} .
$$

For $u \in W_{k T}^{1, p(t)}\left(0, k T ; \mathbb{R}^{\mathbb{N}}\right)$, let

$$
\bar{u}:=\frac{1}{k T} \int_{0}^{k T} u(t) \mathrm{d} t, \quad \widetilde{u}(t)=u(t)-\bar{u}
$$

and

$$
\widetilde{W}_{k T}^{1, p(t)}\left(0, k T ; \mathbb{R}^{\mathbb{N}}\right):=\left\{u \in W_{k T}^{1, p(t)}\left(0, k T ; \mathbb{R}^{\mathbb{N}}\right): \int_{0}^{k T} u(t) \mathrm{d} t=0\right\}
$$

then

$$
W_{k T}^{1, p(t)}\left(0, k T ; \mathbb{R}^{\mathbb{N}}\right)=\widetilde{W}_{k T}^{1, p(t)}\left(0, k T ; \mathbb{R}^{\mathbb{N}}\right) \oplus \mathbb{R}^{\mathbb{N}} .
$$

For the sake of convenience, in the following we use $L^{p(t)}, W_{k T}^{1, p(t)}, \widetilde{W}_{k T}^{1, p(t)}$ to denote $L^{p(t)}\left(0, k T ; \mathbb{R}^{\mathbb{N}}\right), W_{k T}^{1, p(t)}\left(0, k T ; \mathbb{R}^{\mathbb{N}}\right), \widetilde{W}_{k T}^{1, p(t)}\left(0, k T ; \mathbb{R}^{\mathbb{N}}\right)$, respectively.

Proposition 2.1 ([4]). For $u \in L^{p(t)}$, one has
(1) $|u|_{p(t)}<1(=1 ;>1) \Leftrightarrow \int_{0}^{k T}|u(t)|^{p(t)} \mathrm{d} t<1(=1 ;>1)$;
(2) $|u|_{p(t)}>1 \Rightarrow|u|_{p(t)}^{p^{-}} \leqslant \int_{0}^{k T}|u(t)|^{p(t)} \mathrm{d} t \leqslant|u|_{p(t)}^{p^{+}},|u|_{p(t)}<1 \Rightarrow|u|_{p(t)}^{p^{+}} \leqslant$ $\int_{0}^{k T}|u(t)|^{p(t)} \mathrm{d} t \leqslant|u|_{p(t)}^{p^{-}} ;$
(3) $|u|_{p(t)} \rightarrow 0 \Leftrightarrow \int_{0}^{k T}|u(t)|^{p(t)} \mathrm{d} t \rightarrow 0,|u|_{p(t)} \rightarrow \infty \Leftrightarrow \int_{0}^{k T}|u(t)|^{p(t)} \mathrm{d} t \rightarrow \infty$.

Proposition 2.2 ([4]). The space $L^{p(t)}$ and $W_{k T}^{1, p(t)}$ are separable and reflexive Banach spaces when $p^{-}>1$.

Proposition 2.3 ([4]). There is a continuous embedding $W_{k T}^{1, p(t)} \hookrightarrow C\left(0, k T ; \mathbb{R}^{\mathbb{N}}\right)$; when $p^{-}>1$, it is a compact embedding.

Proposition 2.4 ([4]). For every $u \in \widetilde{W}_{k T}^{1, p(t)}$, there exists $c_{k}>0$ such that $\|u\|_{\infty} \leqslant c_{k}\left|u^{\prime}\right|_{p(t)}$, where $\|u\|_{\infty}:=\max _{t \in[0, k T]}|u(t)|$.

Proposition $2.5([4])$. Let $u=\bar{u}+\widetilde{u}(t) \in W_{k T}^{1, p(t)}$. Then the norm $\left|\widetilde{u}^{\prime}\right|_{p(t)}$ is an equivalent norm on $\widetilde{W}_{k T}^{1, p(t)}$.

Proposition 2.6 ([22]). Let $J_{k}(u):=\int_{0}^{k T}\left|u^{\prime}(t)\right|^{p(t)} / p(t) \mathrm{d} t$ for $u \in W_{k T}^{1, p(t)}$. Then $\left\langle J_{k}^{\prime}(u), v\right\rangle=\int_{0}^{k T}\left(\left|u^{\prime}(t)\right|^{p(t)-2} u^{\prime}(t), v^{\prime}(t)\right) \mathrm{d} t$ for all $u, v \in W_{k T}^{1, p(t)}$, and $J_{k}^{\prime}$ is a mapping of type $\left(S_{+}\right)$, i.e., if $u_{n} \rightharpoonup u$ and $\limsup _{n \rightarrow \infty}\left\langle J_{k}^{\prime}\left(u_{n}\right)-J^{\prime}(u), u_{n}-u\right\rangle \leqslant 0$, then $\left\{u_{n}\right\}$ has a convergent subsequence in $W_{k T}^{1, p(t)}$.

By assumption (H0), the functional

$$
\begin{equation*}
\varphi_{k}(u):=\int_{0}^{k T} \frac{1}{p(t)}\left|u^{\prime}(t)\right|^{p(t)} \mathrm{d} t-\int_{0}^{k T} F(t, u(t)) \mathrm{d} t \tag{2.1}
\end{equation*}
$$

is continuously differentiable, and

$$
\begin{equation*}
\left\langle\varphi_{k}^{\prime}(u), v\right\rangle=\int_{0}^{k T}\left|u^{\prime}(t)\right|^{p(t)-2}\left(u^{\prime}(t), v^{\prime}(t)\right) \mathrm{d} t-\int_{0}^{k T}(\nabla F(t, u(t)), v(t)) \mathrm{d} t \tag{2.2}
\end{equation*}
$$

for all $u, v \in W_{k T}^{1, p(t)}$ (see [22]).
We say that $u \in W_{k T}^{1, p(t)}$ is a weak solution of problem (1.1) if it satisfies

$$
\left\langle\varphi_{k}^{\prime}(u), v\right\rangle=0 \quad \text { for any } v \in W_{k T}^{1, p(t)}
$$

Hence, the $k T$-solutions of problem (1.1) correspond to the critical points of the functional $\varphi_{k}$. In the whole paper, we denote various positive constants as $C_{i}, i=1,2, \ldots$

## 3. Compact conditions

Let us recall the following compact concepts, which can be found in [2], [12], [16].
Definition 3.1. Let $E$ be a real Banach space. We say that $\left\{u_{n}\right\}$ in $E$ is a PalaisSmale sequence ((PS) sequence) for $\varphi_{k}$ if $\varphi_{k}\left(u_{n}\right)$ is bounded and $\varphi_{k}^{\prime}\left(u_{n}\right) \rightarrow 0$ as $n \rightarrow \infty$. The functional $\varphi_{k} \in C^{1}(E, \mathbb{R})$ satisfies the Palais-Smale condition ((PS) condition) if any Palais-Smale sequence contains a convergent subsequence.

Definition 3.2. Let $E$ be a real Banach space. We say that $\left\{u_{n}\right\}$ in $E$ is a Cerami sequence ((C) sequence) for $\varphi_{k}$ if $\varphi_{k}\left(u_{n}\right)$ is bounded and $\varphi_{k}^{\prime}\left(u_{n}\right)\left(1+\left\|u_{n}\right\|\right) \rightarrow 0$ as $n \rightarrow \infty$. The functional $\varphi_{k} \in C^{1}(E, \mathbb{R})$ satisfies the Cerami condition ((C) condition) if any Cerami sequence contains a convergent subsequence.

In this section, we observe that although the energy functional of problem (1.1) may possess unbounded (PS) sequence, we can prove that all (C) sequences of this functional are bounded. Concretely speaking, we have

Lemma 3.3. Assume that (H0), (P), (F1), (F3)-(F5) hold, then the functional $\varphi_{k}$ satisfies condition (C).

Proof. Let $E:=W_{k T}^{1, p(t)}$. Suppose that $\left\{u_{n}\right\} \subset W_{k T}^{1, p(t)}$ is a (C) sequence of $\varphi_{k}$, then one has

$$
\begin{equation*}
\left|\varphi_{k}\left(u_{n}\right)\right| \leqslant C_{1}, \quad\left(1+\left\|u_{n}\right\|\right)\left\|\varphi_{k}^{\prime}\left(u_{n}\right)\right\|_{E^{*}} \leqslant C_{1} \tag{3.1}
\end{equation*}
$$

for all $n \in \mathbb{N}$, where $E^{*}$ is the dual space of $E$.
In the first place, by (F4), there exists $M_{4}>0$ such that

$$
F(t, x) \leqslant M h(|x|)
$$

for all $|x| \geqslant M_{4}$ and a.e. $t \in[0, T]$, which together with assumption (H0) yields

$$
\begin{equation*}
F(t, x) \leqslant M h(|x|)+h_{1}(t) \tag{3.2}
\end{equation*}
$$

for all $x \in \mathbb{R}^{\mathbb{N}}$ and a.e. $t \in[0, k T]$, where $h_{1}(t):=\max _{|x| \leqslant M_{4}} a(|x|) b(t) \geqslant 0$. It follows from (2.1), (3.1) and (3.2) that

$$
\begin{align*}
C_{1} & \geqslant \varphi_{k}\left(u_{n}\right)=\int_{0}^{k T} \frac{1}{p(t)}\left|u_{n}^{\prime}(t)\right|^{p(t)} \mathrm{d} t-\int_{0}^{k T} F\left(t, u_{n}(t)\right) \mathrm{d} t  \tag{3.3}\\
& \geqslant \frac{1}{p^{+}} \int_{0}^{k T}\left|u_{n}^{\prime}(t)\right|^{p(t)} \mathrm{d} t-M \int_{0}^{k T} h\left(\left|u_{n}\right|\right) \mathrm{d} t-\int_{0}^{k T} h_{1}(t) \mathrm{d} t
\end{align*}
$$

On the other hand, by (F5), one has

$$
\begin{equation*}
(\nabla F(t, x), x)-p^{+} F(t, x) \geqslant \theta_{1}(|x|) \tag{3.4}
\end{equation*}
$$

for all $|x| \geqslant M_{1}$ and a.e. $t \in[0, T]$. Let $\Omega_{1 n}:=\left\{t \in[0, k T]:\left|u_{n}(t)\right| \geqslant M_{1}\right\}$, $\Omega_{1 n}^{c}:=\left\{t \in[0, k T]:\left|u_{n}(t)\right|<M_{1}\right\}$ and $h_{2}(t):=\left(p^{+}+M_{1}\right) \max _{|x| \leqslant M_{1}} a(|x|) b(t) \geqslant 0$. It follows from $(2.1),(2.2),(3.1)$ and (3.4) that

$$
\begin{align*}
\left(p^{+}+1\right) C_{1} & \geqslant p^{+} \varphi_{k}\left(u_{n}\right)-\left\langle\varphi_{k}^{\prime}\left(u_{n}\right), u_{n}\right\rangle \geqslant \int_{0}^{k T}\left(\left(\nabla F\left(t, u_{n}\right), u_{n}\right)-p^{+} F\left(t, u_{n}\right)\right) \mathrm{d} t  \tag{3.5}\\
& \geqslant \int_{\Omega_{1 n}} \theta_{1}\left(\left|u_{n}\right|\right) \mathrm{d} t-\int_{0}^{k T} h_{2}(t) \mathrm{d} t
\end{align*}
$$

for all $n \in \mathbb{N}$. Hence, we have

$$
\begin{equation*}
\int_{0}^{k T} \theta_{1}\left(\left|u_{n}\right|\right) \mathrm{d} t=\int_{\Omega_{1 n}} \theta_{1}\left(\left|u_{n}\right|\right) \mathrm{d} t+\int_{\Omega_{1 n}^{c}} \theta_{1}\left(\left|u_{n}\right|\right) \mathrm{d} t \leqslant C_{2} \quad \forall n \in \mathbb{N} \tag{3.6}
\end{equation*}
$$

Next, from assumption (P) and Proposition 2.3, there exists $d>0$ such that

$$
\begin{equation*}
\|u\|_{\infty} \leqslant d\|u\| \tag{3.7}
\end{equation*}
$$

for all $u \in W_{k T}^{1, p(t)}$. By virtue of (3.3), (3.6), (3.7), and noticing that $h(s) / \theta_{1}(s)$ is non-decreasing in $s$ for all $s \in \mathbb{R}^{+}$, we obtain that

$$
\begin{align*}
C_{1} \geqslant \varphi_{k}\left(u_{n}\right) & \geqslant \frac{1}{p^{+}} \int_{0}^{k T}\left|u_{n}^{\prime}(t)\right|^{p(t)} \mathrm{d} t-M \int_{0}^{k T} \frac{h\left(\left|u_{n}\right|\right)}{\theta_{1}\left(\left|u_{n}\right|\right)} \theta_{1}\left(\left|u_{n}\right|\right) \mathrm{d} t-\int_{0}^{k T} h_{1}(t) \mathrm{d} t  \tag{3.8}\\
& \geqslant \frac{1}{p^{+}} \int_{0}^{k T}\left|u_{n}^{\prime}(t)\right|^{p(t)} \mathrm{d} t-M C_{2} \frac{h\left(\left\|u_{n}\right\|_{\infty}\right)}{\theta_{1}\left(\left\|u_{n}\right\|_{\infty}\right)}-\int_{0}^{k T} h_{1}(t) \mathrm{d} t \\
& \geqslant \frac{1}{p^{+}} \int_{0}^{k T}\left|u_{n}^{\prime}(t)\right|^{p(t)} \mathrm{d} t-M C_{2} \frac{h\left(d\left\|u_{n}\right\|\right)}{\theta_{1}\left(d\left\|u_{n}\right\|\right)}-\int_{0}^{k T} h_{1}(t) \mathrm{d} t .
\end{align*}
$$

Finally, we claim $\left\{u_{n}\right\}$ is bounded, otherwise, going if necessary to a subsequence, we assume that $\left\|u_{n}\right\| \rightarrow \infty$ as $n \rightarrow \infty$. Set $v_{n}:=u_{n} /\left\|u_{n}\right\|=\bar{u}_{n} /\left\|u_{n}\right\|+\widetilde{u}_{n}(t) /\left\|u_{n}\right\|=$ $\bar{v}_{n}+\widetilde{v}_{n}(t)$, then $\left\{v_{n}\right\}$ is bounded in $W_{k T}^{1, p(t)}$. Hence, there exists a subsequence, again denoted by $\left\{v_{n}\right\}$, such that

$$
\begin{array}{ll}
v_{n} \rightharpoonup v_{0} & \text { weakly in } W_{k T}^{1, p(t)} \\
v_{n} \rightarrow v_{0} & \text { strongly in } C\left(0, k T ; \mathbb{R}^{\mathbb{N}}\right) . \tag{3.10}
\end{array}
$$

Then, by (3.10), one has

$$
\begin{equation*}
\bar{v}_{n}=\frac{1}{k T} \int_{0}^{k T} v_{n}(t) \mathrm{d} t \rightarrow \frac{1}{k T} \int_{0}^{k T} v_{0}(t) \mathrm{d} t=\bar{v}_{0} \quad \text { as } n \rightarrow \infty \tag{3.11}
\end{equation*}
$$

Dividing both sides of (3.8) by $\left\|u_{n}\right\|^{p^{-}}$, in light of the properties of $\theta_{1}(s)$ and condition (P), we can find that

$$
\begin{aligned}
\frac{C_{1}}{\left\|u_{n}\right\|^{p-}} & \geqslant \frac{1}{p^{+}} \int_{0}^{k T} \frac{\left|u_{n}^{\prime}(t)\right|^{p(t)}}{\left\|u_{n}\right\|^{p^{-}}} \mathrm{d} t-M C_{2} \frac{h\left(d\left\|u_{n}\right\|\right)}{\theta_{1}\left(d\left\|u_{n}\right\|\right)\left\|u_{n}\right\|^{p^{-}}}-\frac{\int_{0}^{k T} h_{1}(t) \mathrm{d} t}{\left\|u_{n}\right\|^{p^{-}}} \\
& \geqslant \frac{1}{p^{+}} \int_{0}^{k T} \frac{\left|u_{n}^{\prime}(t)\right|^{p(t)}}{\left\|u_{n}\right\|^{p(t)}} \mathrm{d} t-M C_{2} d^{p-} \frac{h\left(d\left\|u_{n}\right\|\right)}{\theta_{1}\left(d\left\|u_{n}\right\|\right) d^{p-}\left\|u_{n}\right\|^{p^{-}}}-\frac{\int_{0}^{k T} h_{1}(t) \mathrm{d} t}{\left\|u_{n}\right\|^{p^{-}}} \\
& =\frac{1}{p^{+}} \int_{0}^{k T}\left|v_{n}^{\prime}(t)\right|^{p(t)} \mathrm{d} t-M C_{2} d^{p-} \frac{h\left(d\left\|u_{n}\right\|\right)}{\theta_{1}\left(d\left\|u_{n}\right\|\right) d^{p-}\left\|u_{n}\right\|^{p^{-}}}-\frac{\int_{0}^{k T} h_{1}(t) \mathrm{d} t}{\left\|u_{n}\right\|^{p^{-}}}
\end{aligned}
$$

which implies that

$$
\begin{equation*}
\int_{0}^{k T}\left|v_{n}^{\prime}(t)\right|^{p(t)} \mathrm{d} t \rightarrow 0 \quad \text { as } n \rightarrow \infty \tag{3.12}
\end{equation*}
$$

Then, by Proposition 2.1 (3), one has $\left|v_{n}^{\prime}(t)\right|_{p(t)} \rightarrow 0$ as $n \rightarrow \infty$, which together with Proposition 2.4 and (3.10) yield

$$
\begin{equation*}
v_{n} \rightarrow \bar{v}_{0}=v_{0} \quad \text { as } n \rightarrow \infty . \tag{3.13}
\end{equation*}
$$

Consequently, we get $v_{0} \in \mathbb{R}^{\mathbb{N}}$ and $v_{0} \neq 0$, which implies that

$$
\begin{equation*}
\left|u_{n}(t)\right| \rightarrow \infty \quad \text { as } n \rightarrow \infty \text { uniformly for a.e. } t \in[0, k T] . \tag{3.14}
\end{equation*}
$$

So, from (F1), (F3), (3.14) and Fatou's lemma, we get

$$
\begin{align*}
\liminf _{n \rightarrow \infty} \frac{\int_{0}^{k T} F\left(t, u_{n}(t)\right) \mathrm{d} t}{\left\|u_{n}\right\|^{p^{+}}} & \geqslant \int_{0}^{k T} \liminf _{n \rightarrow \infty} \frac{F\left(t, u_{n}(t)\right)}{\left|u_{n}(t)\right|^{p^{+}}}\left|v_{n}(t)\right|^{p^{+}} \mathrm{d} t  \tag{3.15}\\
& =\int_{0}^{k T} \liminf _{\left|u_{n}(t)\right| \rightarrow \infty} \frac{F\left(t, u_{n}(t)\right)}{\left|u_{n}(t)\right|^{p^{+}}}\left|v_{0}(t)\right|^{p^{+}} \mathrm{d} t>0
\end{align*}
$$

However, by (2.1), (3.1) and (3.12), we have

$$
\begin{aligned}
\frac{\int_{0}^{k T} F\left(t, u_{n}(t)\right) \mathrm{d} t}{\left\|u_{n}\right\|^{p^{+}}} & =\int_{0}^{k T} \frac{1}{p(t)} \frac{\left|u_{n}^{\prime}(t)\right|^{p(t)}}{\left\|u_{n}\right\|^{p^{+}}} \mathrm{d} t-\frac{\varphi_{k}\left(u_{n}\right)}{\left\|u_{n}\right\|^{p^{+}}} \\
& \leqslant \frac{1}{p^{-}} \int_{0}^{k T}\left|\frac{u_{n}^{\prime}(t)}{\left\|u_{n}\right\|}\right|^{p(t)} \mathrm{d} t-\frac{\varphi_{k}\left(u_{n}\right)}{\left\|u_{n}\right\|^{p^{+}}} \\
& =\frac{1}{p^{-}} \int_{0}^{k T}\left|v_{n}^{\prime}(t)\right|^{p(t)} \mathrm{d} t-\frac{\varphi_{k}\left(u_{n}\right)}{\left\|u_{n}\right\|^{p^{+}}}
\end{aligned}
$$

which means that

$$
\liminf _{n \rightarrow \infty} \frac{\int_{0}^{k T} F\left(t, u_{n}\right) \mathrm{d} t}{\left\|u_{n}\right\|^{p^{+}}} \leqslant 0
$$

which contradicts (3.15). Thus, $\left\{u_{n}\right\}$ is bounded in $W_{k T}^{1, p(t)}$.
By Proposition 2.2 and Proposition 2.3, $\left\{u_{n}\right\}$ has a subsequence, again denoted by $\left\{u_{n}\right\}$, such that

$$
\begin{array}{ll}
u_{n} \rightharpoonup u & \text { weakly in } W_{k T}^{1, p(t)} \\
u_{n} \rightarrow u & \text { strongly in } C\left(0, k T ; \mathbb{R}^{\mathbb{N}}\right) \tag{3.17}
\end{array}
$$

Now, we show that $\left\{u_{n}\right\}$ has a subsequence convergent strongly to $u$ in $W_{k T}^{1, p(t)}$. From Proposition 2.6, it suffices to prove that $\limsup _{n \rightarrow \infty}\left\langle J_{k}^{\prime}\left(u_{n}\right)-J_{k}^{\prime}(u), u_{n}-u\right\rangle \leqslant 0$. It follows from (3.7) that

$$
\begin{equation*}
\left|u_{n}(t)\right| \leqslant C_{3} \quad \forall t \in[0, k T] \tag{3.18}
\end{equation*}
$$

From (3.17), (3.18), (H0) and Remark 1.18, we get

$$
\begin{align*}
\left|\int_{0}^{k T}\left(\nabla F\left(t, u_{n}(t)\right), u_{n}(t)-u(t)\right) \mathrm{d} t\right| & \leqslant \int_{0}^{k T}\left|\nabla F\left(t, u_{n}(t)\right)\right|\left|u_{n}(t)-u(t)\right| \mathrm{d} t  \tag{3.19}\\
& \leqslant\left\|u_{n}-u\right\|_{\infty} \int_{0}^{k T} a\left(\left|u_{n}(t)\right|\right) b(t) \mathrm{d} t \\
& \leqslant C_{4}\left\|u_{n}-u\right\|_{\infty} \int_{0}^{k T} b(t) \mathrm{d} t
\end{align*}
$$

Thus, from (3.17), we obtain

$$
\begin{equation*}
\left|\int_{0}^{T}\left(\nabla F\left(t, u_{n}(t)\right), u_{n}(t)-u(t)\right) \mathrm{d} t\right| \rightarrow 0 \quad \text { as } n \rightarrow \infty \tag{3.20}
\end{equation*}
$$

By (3.1) and (3.18), we also have

$$
\begin{equation*}
\left\langle\varphi_{k}^{\prime}\left(u_{n}\right), u_{n}-u\right\rangle \rightarrow 0 \quad \text { as } n \rightarrow \infty . \tag{3.21}
\end{equation*}
$$

Then it follows from (3.20) and (3.21) that

$$
\begin{align*}
\left\langle J_{k}^{\prime}\left(u_{n}\right), u_{n}-u\right\rangle & =\int_{0}^{k T}\left(\left|u_{n}^{\prime}(t)\right|^{p(t)-2} u_{n}^{\prime}(t), u_{n}^{\prime}(t)-u^{\prime}(t)\right) \mathrm{d} t  \tag{3.22}\\
& =\left\langle\varphi_{k}^{\prime}\left(u_{n}\right), u_{n}-u\right\rangle+\int_{0}^{k T}\left(\nabla F\left(t, u_{n}(t)\right), u_{n}(t)-u(t)\right) \mathrm{d} t \rightarrow 0
\end{align*}
$$

as $n \rightarrow \infty$. Moreover, since $J_{k}^{\prime}(u) \in\left(W_{k T}^{1, p(t)}\right)^{*}$, by (3.16), one has

$$
\begin{equation*}
\left\langle J_{k}^{\prime}(u), u_{n}-u\right\rangle \rightarrow 0 \quad \text { as } n \rightarrow \infty, \tag{3.23}
\end{equation*}
$$

which combined with (3.22) implies that

$$
\lim _{n \rightarrow \infty}\left\langle J_{k}^{\prime}\left(u_{n}\right)-J_{k}^{\prime}(u), u_{n}-u\right\rangle=0
$$

Hence, from Proposition 2.6, $\left\{u_{n}\right\}$ has a subsequence convergent strongly to $u$ in $W_{k T}^{1, p(t)}$. This concludes the proof of Lemma 3.3.

Lemma 3.4. Assume that (H0), (P), (F1), (F3) and (F6) hold. Then the functional $\varphi_{k}$ satisfies condition (C).

Proof. From the arguments of Lemma 3.3, we only need to prove that $\left\{u_{n}\right\}$ is bounded in $W_{k T}^{1, p(t)}$. It follows from assumptions (F6) and (H0) that

$$
\begin{equation*}
(\nabla F(t, x), x)-p^{+} F(t, x) \geqslant \theta_{2}(|x|)\left(\frac{F(t, x)}{|x|^{p^{+}}}\right)^{\tau} \tag{3.24}
\end{equation*}
$$

for all $|x| \geqslant M_{2}$ and a.e. $t \in[0, k T]$. Let $\Omega_{2 n}:=\left\{t \in[0, k T]:\left|u_{n}(t)\right| \geqslant M_{2}\right\}$. By (2.1), (2.2), (3.1), (3.7), (3.24), (F1) and the properties of $\theta_{2}(s)$, we obtain

$$
\begin{align*}
\left(p^{+}+1\right) C_{1} & \geqslant p^{+} \varphi_{k}\left(u_{n}\right)-\left\langle\varphi_{k}^{\prime}\left(u_{n}\right), u_{n}\right\rangle  \tag{3.25}\\
& \geqslant \int_{0}^{k T}\left(\left(\nabla F\left(t, u_{n}\right), u_{n}(t)\right)-p^{+} F\left(t, u_{n}\right)\right) \mathrm{d} t \\
& \geqslant \int_{\Omega_{2 n}} \theta_{2}\left(\left|u_{n}\right|\right)\left(\frac{F\left(t, u_{n}\right)}{\left|u_{n}\right|^{p^{+}}}\right)^{\tau} \mathrm{d} t-\int_{0}^{k T} h_{3}(t) \mathrm{d} t \\
& \geqslant \int_{\Omega_{2 n}} \theta_{2}\left(\left\|u_{n}\right\|_{\infty}\right) \frac{F^{\tau}\left(t, u_{n}\right)}{\left\|u_{n}\right\|_{\infty}^{p^{+} \tau} \mathrm{d} t-\int_{0}^{k T} h_{3}(t) \mathrm{d} t} \\
& \geqslant \int_{\Omega_{2 n}} \theta_{2}\left(d\left\|u_{n}\right\|\right) \frac{F^{\tau}\left(t, u_{n}\right)}{d^{p^{+} \tau}\left\|u_{n}\right\|^{p^{+} \tau}} \mathrm{d} t-\int_{0}^{k T} h_{3}(t) \mathrm{d} t
\end{align*}
$$

where $h_{3}(t):=\left(p^{+}+M_{2}\right) \max _{|x| \leqslant M_{2}} a(|x|) b(t) \geqslant 0$. Hence, we see that

$$
\begin{equation*}
\int_{0}^{k T} F^{\tau}\left(t, u_{n}(t)\right) \mathrm{d} t \leqslant \frac{C_{5}}{\theta_{2}\left(d\left\|u_{n}\right\|\right)}\left\|u_{n}\right\|^{p^{+} \tau}+C_{6} \tag{3.26}
\end{equation*}
$$

for all $n \in \mathbb{N}$. Furthermore, by (F1), (3.1), (3.26) and Hölder's inequality, one derives

$$
\begin{align*}
C_{1} \geqslant \varphi_{k}\left(u_{n}\right) & =\int_{0}^{k T} \frac{1}{p(t)}\left|u_{n}^{\prime}(t)\right|^{p(t)} \mathrm{d} t-\int_{0}^{k T} F\left(t, u_{n}(t)\right) \mathrm{d} t  \tag{3.27}\\
& \geqslant \frac{1}{p^{+}} \int_{0}^{k T}\left|u_{n}^{\prime}(t)\right|^{p(t)} \mathrm{d} t-C_{7}\left(\int_{0}^{k T} F^{\tau}\left(t, u_{n}(t)\right) \mathrm{d} t\right)^{1 / \tau} \\
& \geqslant \frac{1}{p^{+}} \int_{0}^{k T}\left|u_{n}^{\prime}(t)\right|^{p(t)} \mathrm{d} t-C_{7}\left(\frac{C_{5}}{\theta_{2}\left(d\left\|u_{n}\right\|\right)}\left\|u_{n}\right\|^{p^{+} \tau}+C_{6}\right)^{1 / \tau} \\
& \geqslant \frac{1}{p^{+}} \int_{0}^{k T}\left|u_{n}^{\prime}(t)\right|^{p(t)} \mathrm{d} t-\frac{C_{8}}{\theta_{2}^{1 / \tau}\left(d\left\|u_{n}\right\|\right)}\left\|u_{n}\right\|^{p^{+}}-C_{9} \quad \forall n \in \mathbb{N} .
\end{align*}
$$

Now, we claim $\left\{u_{n}\right\}$ is bounded, otherwise, going if necessary to a subsequence, we can assume that $\left\|u_{n}\right\| \rightarrow \infty$ as $n \rightarrow \infty$. With the same manner of Lemma 3.3, dividing both sides of (3.27) by $\left\|u_{n}\right\|^{p^{-}}$, using the properties of $\theta_{2}(s)$, we conclude
that $\left|u_{n}(t)\right| \rightarrow \infty$ as $n \rightarrow \infty$ uniformly for a.e. $t \in[0, k T]$. From (F1), (F3) and Fatou's lemma, we get

$$
\begin{equation*}
\liminf _{n \rightarrow \infty} \frac{\int_{0}^{k T} F\left(t, u_{n}\right) \mathrm{d} t}{\left\|u_{n}\right\|^{p^{+}}} \geqslant \int_{0}^{k T} \liminf _{\left|u_{n}\right| \rightarrow \infty} \frac{F\left(t, u_{n}\right)}{\left|u_{n}\right|^{p^{+}}}\left|v_{0}\right|^{p^{+}} \mathrm{d} t>0 \tag{3.28}
\end{equation*}
$$

On the other hand, noting that (3.1) and (3.12), we know that

$$
\liminf _{n \rightarrow \infty} \frac{\int_{0}^{k T} F\left(t, u_{n}\right) \mathrm{d} t}{\left\|u_{n}\right\|^{p^{+}}} \leqslant 0
$$

which contradicts (3.28). Therefore, $\left\{u_{n}\right\}$ is bounded in $W_{k T}^{1, p(t)}$, and then $\varphi_{k}$ satisfies condition (C).

Lemma 3.5. Assume that (H0), (P), (F1), (F3) and (F7) hold. Then the functional $\varphi_{k}$ satisfies condition (C).

Proof. Let $\Omega_{3 n}:=\left\{t \in[0, k T]:\left|u_{n}(t)\right| \geqslant M_{3}\right\}$. It follows from (3.1), (3.7), (H0), (F7) and the properties of $\theta_{3}(s)$ that

$$
\begin{align*}
\left(p^{+}+1\right) C_{1} & \geqslant p^{+} \varphi_{k}\left(u_{n}\right)-\left\langle\varphi_{k}^{\prime}\left(u_{n}\right), u_{n}\right\rangle  \tag{3.29}\\
& \geqslant \int_{0}^{k T}\left(\left(\nabla F\left(t, u_{n}\right), u_{n}\right)-p^{+} F\left(t, u_{n}\right)\right) \mathrm{d} t \\
& \geqslant \int_{\Omega_{3 n}} \theta_{3}\left(\left|u_{n}\right|\right) \frac{\left|\nabla F\left(t, u_{n}\right)\right|^{\sigma}}{\left|u_{n}\right|^{\left(p^{+}-1\right) \sigma} \mathrm{d} t-\int_{0}^{k T} h_{4}(t) \mathrm{d} t} \\
& \geqslant \int_{\Omega_{3 n}} \theta_{3}\left(d\left\|u_{n}\right\|\right) \frac{\left|\nabla F\left(t, u_{n}\right)\right|^{\sigma}}{\left.d^{\left(p^{+}-1\right) \sigma}\left\|u_{n}\right\|\right|^{\left(p^{+}-1\right) \sigma}} \mathrm{d} t-\int_{0}^{k T} h_{4}(t) \mathrm{d} t
\end{align*}
$$

for all $n \in \mathbb{N}$, where $h_{4}(t):=\left(p^{+}+M_{3}\right) \max _{|x| \leqslant M_{3}} a(|x|) b(t) \geqslant 0$. As a consequence, we have

$$
\begin{equation*}
\int_{0}^{k T}\left|\nabla F\left(t, u_{n}\right)\right|^{\sigma} \mathrm{d} t \leqslant \frac{C_{10}}{\theta_{3}\left(d\left\|u_{n}\right\|\right)}\left\|u_{n}\right\|^{\left(p^{+}-1\right) \sigma}+C_{11} \tag{3.30}
\end{equation*}
$$

for all $n \in \mathbb{N}$. Let $1 / \sigma+1 / \sigma^{\prime}=1$, since $\sigma \geqslant p^{-} /\left(p^{-}-1\right)$, by simple computation, we get $p^{-} \geqslant \sigma^{\prime}$. So, there exists continuous embedding $L^{p^{-}}(0, k T ; \mathbb{R}) \hookrightarrow L^{\sigma^{\prime}}(0, k T ; \mathbb{R})$, where $L^{\gamma}(0, k T ; \mathbb{R})$ is the usual $L^{\gamma}$ space, $\gamma=p^{-}, \sigma^{\prime}$. What is more, it is not difficult to see that there exists continuous embedding $L^{p(t)} \hookrightarrow L^{p^{-}}(0, k T ; \mathbb{R})$, which together
with (3.1), (3.30) and Hölder's inequality yields that

$$
\begin{align*}
C_{1} & \geqslant\left\langle\varphi_{k}^{\prime}\left(u_{n}\right), u_{n}\right\rangle=\int_{0}^{k T}\left|u_{n}^{\prime}\right|^{p(t)} \mathrm{d} t-\int_{0}^{k T}\left(\nabla F\left(t, u_{n}\right), u_{n}\right) \mathrm{d} t  \tag{3.31}\\
& \geqslant \int_{0}^{k T}\left|u_{n}^{\prime}\right|^{p(t)} \mathrm{d} t-\left(\int_{0}^{k T}\left|\nabla F\left(t, u_{n}\right)\right|^{\sigma} \mathrm{d} t\right)^{1 / \sigma}\left(\int_{0}^{k T}\left|u_{n}\right|^{\sigma^{\prime}} \mathrm{d} t\right)^{1 / \sigma^{\prime}} \\
& \geqslant \int_{0}^{k T}\left|u_{n}^{\prime}\right|^{p(t)} \mathrm{d} t-\left(\frac{C_{10}}{\theta_{3}\left(d\left\|u_{n}\right\|\right)}\left\|u_{n}\right\|^{\left(p^{+}-1\right) \sigma}+C_{11}\right)^{1 / \sigma} C_{12}\left(\int_{0}^{k T}\left|u_{n}\right|^{p^{-}} \mathrm{d} t\right)^{1 / p^{-}} \\
& \geqslant \int_{0}^{k T}\left|u_{n}^{\prime}\right|^{p(t)} \mathrm{d} t-\left(\frac{C_{10}}{\theta_{3}\left(d\left\|u_{n}\right\|\right)}\left\|u_{n}\right\|^{\left(p^{+}-1\right) \sigma}+C_{11}\right)^{1 / \sigma} C_{12}\left|u_{n}\right|_{p(t)} \\
& \geqslant \int_{0}^{k T}\left|u_{n}^{\prime}\right|^{p(t)} \mathrm{d} t-\left(\frac{C_{10}}{\theta_{3}\left(d\left\|u_{n}\right\|\right)}\left\|u_{n}\right\|^{\left(p^{+}-1\right) \sigma}+C_{11}\right)^{1 / \sigma} C_{12}\left\|u_{n}\right\| \\
& \geqslant \int_{0}^{k T}\left|u_{n}^{\prime}\right|^{p(t)} \mathrm{d} t-\frac{C_{13}}{\theta_{3}^{1 / \sigma}\left(d\left\|u_{n}\right\|\right)}\left\|u_{n}\right\|^{p^{+}}-C_{14}\left\|u_{n}\right\| \quad \forall n \in \mathbb{N} .
\end{align*}
$$

Finally, we claim $\left\{u_{n}\right\}$ is bounded, otherwise, going if necessary to a subsequence, we assume that $\left\|u_{n}\right\| \rightarrow \infty$ as $n \rightarrow \infty$. In the same way as in the proof of Lemma 3.3, multiplying both sides of (3.31) by $\left\|u_{n}\right\|^{-p^{-}}$, we can obtain that $\left|u_{n}(t)\right| \rightarrow \infty$ as $n \rightarrow \infty$ uniformly for a.e. $t \in[0, k T]$, and then from (F1), (F3) and Fatou's lemma, we obtain that

$$
\begin{equation*}
\liminf _{n \rightarrow \infty} \frac{\int_{0}^{T} F\left(t, u_{n}\right) \mathrm{d} t}{\left\|u_{n}\right\|^{p^{+}}}>0 \tag{3.32}
\end{equation*}
$$

On the other hand, note that (3.1) and (3.12) imply that

$$
\liminf _{n \rightarrow \infty} \frac{\int_{0}^{T} F\left(t, u_{n}\right) \mathrm{d} t}{\left\|u_{n}\right\|^{p^{+}}} \leqslant 0
$$

which contradicts (3.32). Thus, $\left\{u_{n}\right\}$ is bounded in $W_{k T}^{1, p(t)}$. Using the same arguments as in Lemma 3.3, we know that $\varphi_{k}$ satisfies condition (C).

## 4. Proofs of main results

In this section, we shall use the following generalized mountain pass theorem to prove our results.

Theorem 4.1 ([16]). Let $E$ be a real Banach space with $E=V \oplus X$, where $V$ is finite dimensional. Suppose $\varphi_{k} \in C^{1}(E, \mathbb{R})$ satisfies the (PS) condition, and
(i) there exist $\varrho_{k}, \alpha>0$ such that $\left.\varphi_{k}\right|_{\partial B_{e_{k}} \cap X} \geqslant \alpha$, where $B_{\varrho_{k}}:=\left\{u \in E:\|u\|<\varrho_{k}\right\}$, $\partial B_{\varrho_{k}}$ denotes the boundary of $B_{\varrho_{k}}$;
(ii) there exist $e_{k} \in \partial B_{1} \cap X$ and $s_{0}>\varrho_{k}$ such that if $Q_{k}: \equiv\left(\bar{B}_{s_{0}} \cap V\right) \oplus\left\{s e_{k}: 0 \leqslant\right.$ $\left.s \leqslant s_{0}\right\}$, then $\left.\varphi\right|_{\partial Q_{k}} \leqslant 0$.
Then $\varphi$ possesses a critical value $c \geqslant \alpha$ which can be characterized as

$$
c:=\inf _{h \in \Gamma} \max _{u \in Q} \varphi_{k}(h(u)),
$$

where $\Gamma:=\left\{h \in C\left(\bar{Q}_{k}, E\right): h=\mathrm{id}\right.$ on $\left.\partial Q_{k}\right\}$; here, id denotes the identity operator.
Remark 4.2. It is well known that Theorem 4.1 holds based on the deformation lemma (see [12] or [16]). As shown in [1], the deformation lemma can be proved with the weaker condition (C) replacing the usual (PS) condition, and it turns out that the generalized mountain pass theorem holds true under condition (C).

Now we prove our main results. We only give the proofs of Theorem 1.4, Theorem 1.7, Theorem 1.9, Corollary 1.11, Corollary 1.14, Corollary 1.16 and Corollary 1.17. The other results can be proved similarly.

Proof of Theorem 1.4. Let $X:=\widetilde{W}_{k T}^{1, p(t)}, V:=\mathbb{R}^{\mathbb{N}}$, recalling $E=W_{k T}^{1, p(t)}$, then $E=V \oplus X$ and $\operatorname{dim} V<\infty$. From Lemma 3.3, we see that $\varphi_{k}$ satisfies condition (C). By virtue of Theorem 4.1 and Remark 4.2, we only need to verify the assertions:
(a) $\inf _{u \in S} \varphi_{k}(u)>0$;
(b) $\sup _{u \in Q_{k}} \varphi_{k}(u)<\infty, \sup _{u \in \partial Q_{k}} \varphi(u) \leqslant 0$,
where $S:=\widetilde{W}_{k T}^{1, p(t)} \cap \partial B_{\varrho_{k}}, Q_{k}:=\left\{s e_{k}: 0 \leqslant s \leqslant R_{1}, e_{k}(t) \in \widetilde{W}_{k T}^{1, p(t)}\right\} \oplus\left\{x \in \mathbb{R}^{\mathbb{N}}\right.$ : $\left.|x| \leqslant R_{2}\right\}$ and $\varrho_{k}<R_{1}$. Firstly, by (F2) and (H0), we know that for any positive constant $\varepsilon_{1}<\min \left\{c_{k}, 1 / p^{+} k T c_{k}^{p^{+}}\right\}$, there exists $\delta \in\left(0, \varepsilon_{1}\right)$ such that

$$
\begin{equation*}
F(t, x) \leqslant \varepsilon_{1}|x|^{p^{+}} \quad \forall|x| \leqslant \delta \text { and a.e. } t \in[0, k T] . \tag{4.1}
\end{equation*}
$$

Let $\varrho_{k} \in\left(0, \delta / c_{k}\right)$ and by Proposition 2.5 set $S=\left\{u \in \widetilde{W}_{k T}^{1, p(t)}:\left|u^{\prime}\right|_{p(t)}=\varrho_{k}\right\}$ for all $u \in S$, by Proposition 2.4, we get $|u(t)| \leqslant c_{k}\left|u^{\prime}\right|_{p(t)}=c_{k} \varrho_{k} \leqslant \delta$. Since $0<\varrho_{k}<1$, then it follows from Proposition 2.1 (2), (4.1) and Proposition 2.4 that

$$
\begin{aligned}
\varphi_{k}(u) & =\int_{0}^{k T} \frac{1}{p(t)}\left|u^{\prime}(t)\right|^{p(t)} \mathrm{d} t-\int_{0}^{k T} F(t, u(t)) \mathrm{d} t \\
& \geqslant \frac{1}{p^{+}} \int_{0}^{k T}\left|u^{\prime}(t)\right|^{p(t)} \mathrm{d} t-\varepsilon_{1} \int_{0}^{k T}|u(t)|^{p^{+}} \mathrm{d} t \\
& \geqslant \frac{1}{p^{+}}\left|u^{\prime}\right|_{p(t)}^{p^{+}}-\varepsilon_{1} k T c_{k}^{p^{+}}\left|u^{\prime}\right|_{p(t)}^{p^{+}}=\left(\frac{1}{p^{+}}-\varepsilon_{1} k T c_{k}^{p^{+}}\right) \varrho_{k}^{p^{+}} \\
& =\alpha>0 \quad \forall u \in S .
\end{aligned}
$$

This establishes (a). Next, we check (b).

Let $f(t):=\lim _{|x| \rightarrow \infty} F(t, x) /|x|^{p^{+}}, \quad E_{0}:=\{t \in[0, T]: f(t)=0\}$, then by (F3), $\operatorname{meas}\left(E_{0}\right)=0$ and $f(t)>0$ on $[0, T] \backslash E_{0}$. Let $E_{m}:=\{t \in[0, T]: f(t) \geqslant 1 / m\}$, $m \in \mathbb{N}$, then $[0, T] \backslash E_{0}=\bigcup_{m=1}^{\infty} E_{m}$, meas $\left(\bigcup_{m=1}^{\infty} E_{m}\right)=T$ and $\lim _{m \rightarrow \infty} \operatorname{meas}\left(E_{m}\right)=T$. Therefore, for any $\varepsilon>0$, there exist a small number $\varepsilon_{2}=\varepsilon_{2}(\varepsilon)>0$ (which is independent of $k$ ) and a subset $E_{\varepsilon} \subset \bigcup_{m=1}^{\infty} E_{m} \subset[0, T]$ such that

$$
T-\varepsilon \leqslant \operatorname{meas}\left(E_{\varepsilon}\right) \leqslant T \quad \text { and } \quad f(t) \geqslant 2 \varepsilon_{2} \text { on } E_{\varepsilon}
$$

Let $E_{\varepsilon}^{k}:=\bigcup_{j=0}^{k-1}\left(E_{\varepsilon}+j T\right)$, where $E_{\varepsilon}+j T:=\left\{t+j T: t \in E_{\varepsilon}\right\}, j=0,1, \ldots, k-1$.
Then

$$
k T-k \varepsilon \leqslant \operatorname{meas}\left(E_{\varepsilon}^{k}\right) \leqslant k T
$$

hence,

$$
\begin{equation*}
\operatorname{meas}\left([0, k T] \backslash E_{\varepsilon}^{k}\right) \leqslant k \varepsilon \tag{4.2}
\end{equation*}
$$

Furthermore, by the periodicity of $F(t, x)$ in $t$, we get

$$
f(t) \geqslant 2 \varepsilon_{2} \quad \text { on } E_{\varepsilon}^{k}
$$

Again, by (F3) and (H0), there exists $M_{5}=M_{5}(\varepsilon)>0$ such that

$$
F(t, x) \geqslant \varepsilon_{2}|x|^{p^{+}} \quad \forall|x| \geqslant M_{5} \text { and } t \in E_{\varepsilon}^{k}
$$

Therefore, for all $x \in \mathbb{R}^{\mathbb{N}}$ and $t \in E_{\varepsilon}^{k}$ we have

$$
F(t, x) \geqslant \varepsilon_{2}|x|^{p^{+}}-\varepsilon_{2} M_{5}^{p^{+}}
$$

which combining with (F1) implies that for all $u \in W_{k T}^{1, p(t)}$,

$$
\begin{align*}
\int_{0}^{k T} F(t, u) \mathrm{d} t & \geqslant \int_{E_{\varepsilon}^{k}} F(t, u) \mathrm{d} t \geqslant \varepsilon_{2} \int_{E_{\varepsilon}^{k}}|u|^{p^{+}} \mathrm{d} t-\varepsilon_{2} M_{5}^{p^{+}} k T  \tag{4.3}\\
& =\varepsilon_{2} \int_{0}^{k T}|u|^{p^{+}} \mathrm{d} t-\varepsilon_{2} M_{5}^{p^{+}} k T-\varepsilon_{2} \int_{[0, k T] \backslash E_{\varepsilon}^{k}}|u|^{p^{+}} \mathrm{d} t
\end{align*}
$$

Choose $e_{k}:=\left(\sin \left(k^{-1} \omega t\right), 0, \ldots, 0\right) \in \widetilde{W}_{k T}^{1, p(t)}$, where $\omega:=2 \pi / T$. Let $\bar{W}_{k T}^{1, p(t)}:=$ $\mathbb{R}^{\mathbb{N}} \oplus \operatorname{span}\left\{e_{k}\right\}$. Since $\operatorname{dim}\left(\bar{W}_{T}^{1, p(t)}\right)=n+1$, one has

$$
\begin{equation*}
\left(\int_{0}^{T}|u|^{p^{+}} \mathrm{d} t\right)^{1 / p^{+}} \geqslant C_{15}\left(\int_{0}^{T}|u|^{2} \mathrm{~d} t\right)^{1 / 2} \quad \forall u \in \bar{W}_{T}^{1, p(t)} \tag{4.4}
\end{equation*}
$$

Let $|s|^{\widetilde{p}}:=\max \left\{|s|^{p^{-}},|s|^{p^{+}}\right\}, \omega^{\widetilde{p}^{*}}:=\max \left\{\omega^{p^{-}}, \omega^{p^{+}}\right\}, A:=\left(1 / p^{-}\right) \omega^{\widetilde{p}^{*}} \int_{0}^{T} 1 \times$ $|\cos \omega t|^{p(t)} \mathrm{d} t$. Bearing in mind that $Q_{k}=\left\{s e_{k}: 0 \leqslant s \leqslant R_{1}\right\} \oplus\left\{x \in \mathbb{R}^{\mathbb{N}}:|x| \leqslant R_{2}\right\}$ with $R_{1} \geqslant 1>\varrho_{k}$ and $R_{2}>0$ being specified below, observe that by (4.3), (4.4), (P) and Hölder inequality, for $x+s e_{k} \in \widetilde{W}_{k T}^{1, p(t)}$, one has

$$
\begin{align*}
\varphi_{k}\left(x+s e_{k}\right)= & \int_{0}^{k T} \frac{1}{p(t)}\left|s e_{k}^{\prime}\right|^{p(t)} \mathrm{d} t-\int_{0}^{k T} F\left(t, x+s e_{k}\right) \mathrm{d} t  \tag{4.5}\\
\leqslant & \frac{1}{p^{-}} k^{-p^{-}} \omega^{\tilde{p}^{*}}|s|^{\widetilde{p}} \int_{0}^{k T}\left|\cos k^{-1} \omega t\right|^{p(t)} \mathrm{d} t-\varepsilon_{2} \int_{0}^{k T}\left|x+s e_{k}\right|^{p^{+}} \mathrm{d} t \\
& +\varepsilon_{2} M_{5}^{p^{+}} k T+\varepsilon_{2} \int_{[0, k T] \backslash E_{\varepsilon}^{k}}\left|x+s e_{k}\right|^{p^{+}} \mathrm{d} t \\
\leqslant & \frac{1}{p^{-}} k^{-p^{-}+1} \omega^{\widetilde{p}^{*}}|s|^{\widetilde{p}} \int_{0}^{T}|\cos \omega t|^{p(t)} \mathrm{d} t+\varepsilon_{2} M_{5}^{p^{+}} k T \\
& -\varepsilon_{2} k \int_{0}^{T}\left|x+s e_{1}\right|^{p^{+}} \mathrm{d} t+2^{p^{+}} \varepsilon_{2} \int_{[0, k T] \backslash E_{\varepsilon}^{k}}\left(|x|^{p^{+}}+|s|^{p^{+}}\right) \mathrm{d} t \\
\leqslant & A k^{-p^{-}+1}|s|^{\widetilde{p}}-\varepsilon_{2} k C_{15}^{p^{+}}\left(\int_{0}^{T}\left|x+s e_{1}\right|^{2} \mathrm{~d} t\right)^{p^{+} / 2} \\
& +\varepsilon_{2} M_{5}^{p^{+}} k T+2^{p^{+}} \varepsilon_{2} k \varepsilon\left(|x|^{p^{+}}+|s|^{p^{+}}\right) \\
\leqslant & A k^{-p^{-}+1}|s|^{\widetilde{p}}-\varepsilon_{2} k C_{15}^{p^{+}}\left(\int_{0}^{T}\left(|x|^{2}+|s|^{2}\left|e_{1}\right|^{2}\right) \mathrm{d} t\right)^{p^{+} / 2} \\
& +\varepsilon_{2} M_{5}^{p^{+}} k T+2^{p^{+}} \varepsilon_{2} k \varepsilon\left(R_{1}^{p^{+}}+R_{2}^{p^{+}}\right) \\
\leqslant & A k^{-p^{-}+1}|s|^{\widetilde{p}}-\varepsilon_{2} k C_{16}|x|^{p^{+}}-\varepsilon_{2} k C_{16}|s|^{p^{+}}+\varepsilon_{2} M_{5}^{p^{+}} k T \\
& +2^{p^{+}} \varepsilon_{2} k \varepsilon\left(R_{1}^{p^{+}}+R_{2}^{p^{+}}\right) .
\end{align*}
$$

If $k \geqslant\left(2 A / \varepsilon_{2} C_{16}\right)^{1 / p^{-}}$, then we have

$$
\begin{align*}
k^{-1} \varphi_{k}\left(x+s e_{k}\right) & \leqslant A k^{-p^{-}}|s|^{\widetilde{p}}-\varepsilon_{2} C_{16}|s|^{p^{+}}+\varepsilon_{2} M_{5}^{p^{+}} T+2^{p^{+}} \varepsilon_{2} \varepsilon\left(R_{1}^{p^{+}}+R_{2}^{p^{+}}\right)  \tag{4.6}\\
& \leqslant \frac{1}{2} \varepsilon_{2} C_{16}|s|^{\widetilde{p}}-\varepsilon_{2} C_{16}|s|^{p^{+}}+\varepsilon_{2} M_{5}^{p^{+}} T+2^{p^{+}} \varepsilon_{2} \varepsilon\left(R_{1}^{p^{+}}+R_{2}^{p^{+}}\right)
\end{align*}
$$

and

$$
\begin{align*}
k^{-1} \varphi_{k}\left(x+s e_{k}\right) & \leqslant A k^{-p^{-}}|s|^{\widetilde{p}}-\varepsilon_{2} C_{16}|x|^{p^{+}}+\varepsilon_{2} M_{5}^{p^{+}} T+2^{p^{+}} \varepsilon_{2} \varepsilon\left(R_{1}^{p^{+}}+R_{2}^{p^{+}}\right)  \tag{4.7}\\
& \leqslant \frac{1}{2} \varepsilon_{2} C_{16}|s|^{\widetilde{p}}-\varepsilon_{2} C_{16}|x|^{p^{+}}+\varepsilon_{2} M_{5}^{p^{+}} T+2^{p^{+}} \varepsilon_{2} \varepsilon\left(R_{1}^{p^{+}}+R_{2}^{p^{+}}\right)
\end{align*}
$$

Without loss of generality, we assume $\varepsilon<C_{16} / 2^{p^{+}+3}$ and $M_{5}=M_{5}(\varepsilon) \geqslant$ $\left(C_{16} / 4 T\right)^{1 / p^{+}}$. Then

$$
R:=M_{5}\left(\frac{4 T}{C_{16}}\right)^{1 / p^{+}} \geqslant 1
$$

Put $R_{1}=R_{2}=R$. Then for all $x+R_{1} e_{k} \in \partial Q_{k}$, note $|s|^{\widetilde{p}}=|s|^{p^{+}}$for $|s| \geqslant 1$. It follows from (4.6) that

$$
\frac{1}{\varepsilon_{2} k} \varphi_{k}\left(x+R_{1} e_{k}\right) \leqslant-\frac{1}{2} C_{16} R^{p^{+}}+M_{5}^{p^{+}} T+2^{p^{+}+1} R^{p^{+}} \varepsilon \leqslant-\frac{1}{4} C_{16} R^{p^{+}}+M_{5}^{p^{+}} T=0
$$

and for all $x+s e_{k} \in \partial Q_{k}$ with $|x|=R_{2}$ it follows from (4.7) that

$$
\begin{aligned}
\frac{1}{\varepsilon_{2} k} \varphi_{k}\left(x+R_{1} e_{k}\right) & \leqslant \frac{1}{2} C_{16}|s|^{\widetilde{p}}-C_{16}|x|^{p^{+}}+M_{5}^{p^{+}} T+2^{p^{+}} \varepsilon\left(R_{1}^{p^{+}}+R_{2}^{p^{+}}\right) \\
& \leqslant-\frac{1}{2} C_{16} R^{p^{+}}+M_{5}^{p^{+}} T+2^{p^{+}+1} \varepsilon R^{p^{+}} \leqslant-\frac{1}{4} C_{16} R^{p^{+}}+M_{5}^{p^{+}} T=0 .
\end{aligned}
$$

It follows from (F1) that $\varphi_{k}(x)=-\int_{0}^{k T} F(t, x) \mathrm{d} t \leqslant 0$ for all $x \in \mathbb{R}^{\mathbb{N}}$. Hence, we get

$$
\varphi_{k}\left(x+s e_{k}\right) \leqslant 0 \quad \forall x+s e_{k} \in \partial Q_{k}
$$

which implies that (b) holds.
Furthermore, for all $x+s e_{k} \in Q_{k}$, by (F1) and (P), we have

$$
\begin{aligned}
\varphi_{k}\left(x+s e_{k}\right) & =\int_{0}^{k T} \frac{1}{p(t)}\left|s e_{k}^{\prime}\right|^{p(t)} \mathrm{d} t-\int_{0}^{k T} F\left(t, x+s e_{k}\right) \mathrm{d} t \\
& \leqslant \frac{1}{p^{-}} k^{-p^{-}} \omega^{\widetilde{p^{*}}}|s|^{\widetilde{p}} \int_{0}^{k T}\left|\cos k^{-1} \omega t\right|^{p(t)} \mathrm{d} t \\
& \leqslant A k^{-p^{-}+1}|s|^{\widetilde{p}} \leqslant A|s|^{\widetilde{p}} \leqslant A \max \left\{M_{5}\left(\frac{4 T}{C_{16}}\right)^{1 / p^{+}}, 1\right\}^{\widetilde{p}} .
\end{aligned}
$$

Thus, for any positive integer $k \geqslant\left(2 A / \varepsilon_{2} C_{16}\right)^{1 / p^{-}}, \varphi_{k}$ has at least one critical point $u_{k}$ in $W_{k T}^{1, p(t)}$ and

$$
\begin{equation*}
\varphi_{k}\left(u_{k}\right) \leqslant A \max \left\{M_{5}\left(\frac{4 T}{C_{16}}\right)^{1 / p^{+}}, 1\right\}^{\widetilde{p}} . \tag{4.8}
\end{equation*}
$$

For $k_{1} \geqslant\left(2 A /\left(\varepsilon_{2} C_{16}\right)\right)^{1 / p^{-}}$we obtain a $k_{1} T$-periodic solution $u_{k_{1}}$. We claim that there exists a positive integer $k_{2}>k_{1}$ such that $u_{k k_{1}} \neq u_{k_{1}}$ for all $k k_{1} \geqslant k_{2}$. Otherwise, $\varphi_{k k_{1}}\left(u_{k k_{1}}\right)=k \varphi_{k_{1}}\left(u_{k_{1}}\right) \rightarrow \infty$ as $k \rightarrow \infty$, which contradicts (4.8). Repeating this process, we obtain a sequence $\left\{u_{k_{j}}\right\}$ of distinct nontrivial periodic solutions of problem (1.1). This completes the proof of Theorem 1.4.

Proof of Theorem 1.7. From Lemma 3.4, using the same arguments of Theorem 1.4, we see that problem (1.1) has a sequence of distinct periodic solutions with period $k_{j} T$ satisfying $k_{j} \in \mathbb{N}$ and $k_{j} \rightarrow \infty$ as $j \rightarrow \infty$.

Pr o of of Theorem 1.9. Clearly, with the aid of Lemma 3.5 and the arguments of Theorem 1.4, we can easily see that problem (1.1) has a sequence of distinct periodic solutions with period $k_{j} T$ satisfying $k_{j} \in \mathbb{N}$ and $k_{j} \rightarrow \infty$ as $j \rightarrow \infty$.

Pro of of Corollary 1.11. Taking $h(s)=s^{p^{+}}$, by Theorem 1.4, we can obtain that problem (1.1) has a sequence of distinct periodic solutions with period $k_{j} T$ satisfying $k_{j} \in \mathbb{N}$ and $k_{j} \rightarrow \infty$ as $j \rightarrow \infty$ immediately.

Proof of Corollary 1.14. From (F3) and (F4') we conclude that $F(t, x)$ is positive and asymptotic- $p^{+}$for all $|x|$ large enough and a.e. $t \in[0, T]$, thus, (F6) is equivalent to ( $\mathrm{F} 6^{\prime}$ ). By Theorem 1.7, problem (1.1) has a sequence of distinct periodic solutions with period $k_{j} T$ satisfying $k_{j} \in \mathbb{N}$ and $k_{j} \rightarrow \infty$ as $j \rightarrow \infty$.

Pro of of Corollary 1.16. Applying (F3), (F4') and (F7'), we have

$$
\begin{equation*}
M \geqslant \frac{|\nabla F(t, x)|}{|x|^{p^{+}-1}} \geqslant \frac{(\nabla F(t, x), x)}{|x|^{p^{+}}} \geqslant \frac{p^{+} F(t, x)}{|x|^{p^{+}}}>0 \tag{4.9}
\end{equation*}
$$

for $|x|$ large enough and a.e. $t \in[0, T]$. From (4.9), we deduce that $|\nabla F(t, x)|$ is positive and asymptotic- $p^{+}$for all $|x|$ large enough and a.e. $t \in[0, T]$, which means (F7) and $\left(\mathrm{F} 7^{\prime}\right)$ are equivalent. Then, by Theorem 1.9, problem (1.1) has a sequence of distinct periodic solutions with period $k_{j} T$ satisfying $k_{j} \in \mathbb{N}$ and $k_{j} \rightarrow \infty$ as $j \rightarrow \infty$.

Pro of of Corollary 1.17. By (F3') and (F7' ${ }^{\prime \prime}$ ), one has

$$
\frac{F(t, x)}{|x|^{p^{+}}} \geqslant \frac{(\nabla F(t, x), x)}{p^{+}|x|^{p^{+}}}>0
$$

for $|x|$ large enough and a.e. $t \in[0, T]$, which implies (F3) holds. Moreover, utilizing $\left(\mathrm{F} 3^{\prime}\right)$ and ( $\mathrm{F} 4^{\prime \prime}$ ), we have

$$
M \geqslant \frac{|\nabla F(t, x)|}{|x|^{p^{+}-1}} \geqslant \frac{(\nabla F(t, x), x)}{|x|^{p^{+}}}>0 .
$$

Therefore, we know that $|\nabla F(t, x)|$ is also positive and asymptotic- $p^{+}$for all $|x|$ large enough and a.e. $t \in[0, T]$. From Corollary 1.16, we can deduce that problem (1.1) has a sequence of distinct periodic solutions with period $k_{j} T$ satisfying $k_{j} \in \mathbb{N}$ and $k_{j} \rightarrow \infty$ as $j \rightarrow \infty$.

## 5. Example

In this section, we give an example to illustrate that our results are new even in the case $p(t) \equiv p=2$.

Example 5.1. Let

$$
\alpha(t):= \begin{cases}\sin (2 \pi / T) t, & t \in\left[0, \frac{1}{2} T\right] \\ 0, & t \in\left[\frac{1}{2} T, T\right]\end{cases}
$$

and $D(t):=12-\alpha(t)\left(4 \ln (\mathrm{e}+4)+\sin 4-\ln ^{2}(\mathrm{e}+4)\right)>0$. Consider

$$
F(t, x)=\left\{\begin{array}{l}
|x|^{4}, \quad|x| \leqslant 2, \\
\alpha(t)\left(|x|^{2} \ln \left(\mathrm{e}+|x|^{2}\right)+\sin |x|^{2}-\ln ^{2}\left(\mathrm{e}+|x|^{2}\right)\right)+|x|^{2}+D(t), \quad|x|>2 .
\end{array}\right.
$$

It is easy to check that $F(t, x)$ is superquadratic at infinity when $t \in\left[0, \frac{1}{2} T\right]$ and asymptotically quadratic at infinity when $t \in\left[\frac{1}{2} T, T\right]$. Then, Theorem 1.2 , Theorem 1.3 and the conclusions of [5]-[7], [13]-[15], [17]-[20], [29], [32] cannot treat this case. Furthermore, by simple computation, one has $\liminf _{|x| \rightarrow \infty}((\nabla F(t, x), x)-$ $2 F(t, x))|x|^{-\lambda}=0$ uniformly for a.e. $t \in\left[0, \frac{1}{2} T\right]$ and all $\lambda>0$, which implies that $F(t, x)$ does not satisfy the results of Theorem 1.1. However for all $s \geqslant 0$, select $h(s)=s^{2} \ln \left(\mathrm{e}+s^{2}\right), \theta_{1}(s)=\ln ^{2}\left(\mathrm{e}+s^{2}\right)$, a direct computation shows that $F(t, x)$ satisfies all conditions of Theorem 1.4 with $p(t) \equiv p=2$. Hence, problem (1.1) with $p(t) \equiv p=2$ has a sequence of distinct periodic solutions with period $k_{j} T$ satisfying $k_{j} \in \mathbb{N}$ and $k_{j} \rightarrow \infty$ as $j \rightarrow \infty$.
