## ON CONDENSATION NUMBERS

P. B. KRIKELIS

Athens

In this note we consider the weight (=character) of a topological space at a point and some other cardinal numbers which describe the “condensation” of points at a given point.

**Notation.** The cardinal number of a set  $B$  is denoted by  $\text{card } B$ . We denote by  $k$  a fixed sufficiently large cardinal,  $K$  denotes the set of cardinals  $\leq k$ , and  $\hat{K}$  denotes the Kurepa completion of  $K$ ;  $l$  will denote an element of  $\hat{K}$ . The letter  $E$  denotes a topological space,  $\alpha$  a point of  $E$ ,  $V$  a neighbourhood of  $\alpha$  in  $E$ ,  $B$  a subset of  $E$ ,  $\bar{B}$  the closure of  $B$ . The weight of  $E$  at  $\alpha$  is denoted by  $w(\alpha)$ .

$P(\alpha, l)$  will be an abbreviation for “if  $\alpha \notin B$  and  $\text{card } B \leq l$ , then  $\alpha \notin \bar{B}$ ”. If  $\alpha$  is given,  $l(\alpha)$  will denote any  $l$  for which  $P(\alpha, l)$  holds. We can consider the following elements of  $\hat{K}$ :  $\sup_{\alpha \in E} l(\alpha)$ ,  $\inf_{\alpha \in E} \sup l(\alpha)$ ,  $\sup_{\alpha \in E} \sup l(\alpha)$ . In particular, if  $\sup_{\alpha \in E} l(\alpha)$  is constant for  $\alpha \in E$ , then  $E$  is “homogeneous” in a certain sense. If not, then the equality  $\sup_{\alpha \in E} l(\alpha_1) = \sup_{\alpha \in E} l(\alpha_2)$  defines a partition of  $E$  which may be worth consideration.

Clearly, if  $0 \leq l \leq \inf_{\alpha \in E} \sup l(\alpha)$ , then  $P(\alpha, l)$  holds for all  $\alpha \in E$ .

**Proposition.** *For every non-isolated  $\alpha \in E$ ,  $w(\alpha) > \sup_{\alpha \in E} l(\alpha)$ .*

This follows at once from the Axiom of Choice; the inequality is strict, due to considering  $\hat{K}$  instead of  $K$ .

Let  $(D, \geq)$  be a directed set and let  $A \subset D$ . Let  $\mathcal{T}$  denote the collection of all maximal totally ordered subsets  $T$  of  $D$  such that for any  $a \in A$  there is an element  $d \in T$  with  $a \geq d$ . In the following we assume that  $A$  is such that  $\bigcup \mathcal{T} = D$ .

For every  $T \in \mathcal{T}$  let  $\mu_T$  denote the least cardinality of a cofinal subset of  $T$ . The set of all numbers  $\mu_T$  will be denoted by  $M(D, A)$ . It can be shown that the supremum (in  $\hat{K}$ ) of the set  $M(D, A)$  is a dimension in the sense of [3], [4]. This supremum will be denoted by  $\text{dep}(D, A)$  and called the depth of  $D$  with respect to  $A$ ; the least cardinal  $\geq \text{dep}(D, A)$  will be denoted by  $\text{dep}^*(D, A)$ . The least cardinality of a cofinal subset of  $D$  will be called the weight of  $D$  and denoted by  $w(D)$ , and the cardinality of  $\mathcal{T}$  will be denoted by  $\text{br}(D, A)$  and called the breadth of  $D$  with respect to  $A$ .

Clearly,  $w(D) \leq \text{dep}^*(D, A) \text{br}(D, A)$ . Hence,  $\text{br}(D, A) = w(D)$  whenever  $\text{dep}^*(D, A) < w(D)$ .

We denote by  $D_\alpha$  the collection of all neighbourhoods of  $\alpha$  (in  $E$ ) ordered by inclusion;  $A_\alpha$  will denote the collection of all neighbourhoods of  $\alpha$  of the form  $E - (x)$ ,  $x \in E$ . We shall call  $\text{dep}^*(D_\alpha, A_\alpha)$  the depth of  $E$  at  $\alpha$ .

**Problem.** Does there exist, for any non-void set  $M$  of infinite cardinal numbers, a normal space  $E$  and a point  $\alpha \in E$  such that  $M(D_\alpha, A_\alpha) = M$ ?

**Proposition.** If  $\text{card } B$  is less than the depth of  $E$  at  $\alpha$ , then  $\alpha \notin \bar{B} - B$ . In particular, if  $\text{dep}^*(D_\alpha, A_\alpha) = w(\alpha)$ , then  $\alpha \in \bar{B} - B$  implies  $w(\alpha) \leq \text{card } B$ .

**Remarks.** 1) The condition  $\text{dep}^*(D_\alpha, A_\alpha) = w(\alpha)$  is more general than the assumption of the existence of a totally ordered basis of neighbourhoods of  $\alpha$ . — 2) Using the cardinal  $\inf_{\alpha \in E} \sup l(\alpha)$  we obtain a classification of topological spaces which starts with the  $T_1$ -spaces (namely,  $E$  is a  $T_1$ -space iff  $\inf_{\alpha \in E} \sup l(\alpha) \geq 1$ ). — 3)  $\inf_{\alpha \in E} \sup l(\alpha)$  and  $\sup_{\alpha \in E} \sup l(\alpha)$  are “dimension functions” in the sense of [3]. — 4) Analogous questions can be investigated in generalized topological spaces; cf. also [1]. — 5) There are certain relations between notions introduced in this note, and  $U$ -sefs considered in [2]. — 6) In the author’s opinion, the term “condensation number at  $\alpha$ ” is preferable to “weight”.
