# THE HENSTOCK-KURZWEIL APPROACH TO YOUNG INTEGRALS WITH INTEGRATORS IN $\mathrm{BV}_{\varphi}$ 

Boonpogkrong Varayu, Tuan Seng Chew, Singapore

(Received September 8, 2005)

## Dedicated to Prof. J. Kurzweil on the occasion of his 80th birthday

Abstract. In 1938, L. C. Young proved that the Moore-Pollard-Stieltjes integral $\int_{a}^{b} f \mathrm{~d} g$ exists if $f \in \operatorname{BV}_{\varphi}[a, b], g \in \mathrm{BV}_{\psi}[a, b]$ and $\sum_{n=1}^{\infty} \varphi^{-1}(1 / n) \psi^{-1}(1 / n)<\infty$. In this note we use the Henstock-Kurzweil approach to handle the above integral defined by Young.

Keywords: Henstock integral, Stieltjes integral, Young integral, $\varphi$-variation
MSC 2000: 26A21, 28B15

## 1. Introduction

In 1936, L. C. Young proved that the Riemann-Stieltjes integral $\int_{a}^{b} f \mathrm{~d} g$ exists, if $f \in \mathrm{BV}_{p}[a, b], g \in \mathrm{BV}_{q}[a, b], 1 / p+1 / q>1$ and $f, g$ do not have common discontinuous points, see [7], [11]. Two years later, he was able to drop the condition on common discontinuity for his new integral (called Young integral), see [12]. The Young integral is defined by the Moore-Pollard approach, see [2, pp. 23-27, pp. 113138] and [3], [8], [9]. In other words, the integral is defined by way of refinements of partitions and the integral is the Moore-Smith limit of the Riemann-Stieltjes sums using the directed set of partitions. However, modified Riemann-Stieltjes sums involving $g(x+)$ and $g(x-)$ are used in Young integrals. Furthermore, he generalized his result and proved that the Young integral $\int_{a}^{b} f \mathrm{~d} g$ exists if the following Young's condition holds:

$$
f \in \mathrm{BV}_{\varphi}[a, b], \quad g \in \mathrm{BV}_{\psi}[a, b]
$$

and

$$
\sum_{n=1}^{\infty} \varphi^{-1}\left(\frac{1}{n}\right) \psi^{-1}\left(\frac{1}{n}\right)<\infty
$$

where $\mathrm{BV}_{\varphi}[a, b]$ is the space of functions of bounded $\varphi$-variation on $[\mathrm{a}, \mathrm{b}]$.
The Young integral with an integrator in $\mathrm{BV}_{p}$ using the Henstock-Kurzweil approach is given in [1]. In this note we will again use the Henstock-Kurzweil approach to handle the Young integral with an integrator in $\mathrm{BV}_{\varphi}$.

Now we shall introduce Henstock-Kurzweil integrals, see [4].
Let $P=\left\{\left[u_{i}, v_{i}\right]\right\}_{i=1}^{n}$ be a finite collection of non-overlapping subintervals of $[a, b]$, then $P$ is said to be a partial partition of $[a, b]$. If, in addition, $\bigcup_{i=1}^{n}\left[u_{i}, v_{i}\right]=[a, b]$, then $P$ is said to be a partition of $[a, b]$.

Let $\delta$ be a positive function on $[a, b],[u, v] \subseteq[a, b]$ and $\xi \in[a, b]$. Then an intervalpoint pair $(\xi,[u, v])$ is said to be $\delta$-fine if $\xi \in[u, v] \subseteq(\xi-\delta(\xi), \xi+\delta(\xi))$. Let $D=\left\{\left(\xi_{i},\left[u_{i}, v_{i}\right]\right)\right\}_{i=1}^{n}$ be a finite collection of interval-point pairs. Then $D$ is said to be a $\delta$-fine partial division of $[a, b]$ if $\left\{\left[u_{i}, v_{i}\right]\right\}_{i=1}^{n}$ is a partial partition of $[a, b]$ and for each $i,\left(\xi_{i},\left[u_{i}, v_{i}\right]\right)$ is $\delta$-fine. In addition, if $\left\{\left[u_{i}, v_{i}\right]\right\}_{i=1}^{n}$ is a partition of $[a, b]$, then $D$ is said to be a $\delta$-fine division of $[a, b]$.

In this note, $\mathbb{R}$ denotes the set of real numbers.
Now, we shall define integrals of Stieltjes type by the Henstock-Kurzweil approach.
Definition 1.1. Let $f, g:[a, b] \rightarrow \mathbb{R}$. Then $f$ is said to be Henstock-Kurzweil integrable (or HK-integrable) to a real number $A$ on $[a, b]$ with respect to $g$ if for every $\varepsilon>0$ there exists a positive function $\delta$ defined on $[a, b]$ such that for every $\delta$-fine division $D=\left\{\left(\xi_{i},\left[t_{i}, t_{i+1}\right]\right)\right\}_{i=1}^{n}$ of $[a, b]$, we have

$$
|S(f, \delta, D)-A| \leqslant \varepsilon,
$$

where

$$
S(f, \delta, D)=\sum_{i=1}^{n} f\left(\xi_{i}\right)\left(g\left(t_{i+1}\right)-g\left(t_{i}\right)\right)
$$

$A$ is denoted by $\int_{a}^{b} f \mathrm{~d} g$.
It is known that if $f \in \mathrm{BV}_{p}[a, b], g \in \mathrm{BV}_{q}[a, b], 1 / p+1 / q>1$, then $f$ is HKintegrable with respect to $g$ on $[a, b]$, see [1].

In this note we follow ideas of Young to show that if $f \in \mathrm{BV}_{\varphi}[a, b], g \in \mathrm{BV}_{\psi}[a, b]$ and $\sum_{n=1}^{\infty} \varphi^{-1}(1 / n) \psi^{-1}(1 / n)<\infty$, then $f$ is HK-integrable with respect to $g$ on $[a, b]$.

## 2. Young's series

The above series is called Young's series. We shall present some properties of Young's series. Results and proofs are known, see [5], [6], [12]. We give proofs here for easy reference.

In this section, let $\lambda, \mu$ be strictly increasing continuous non-negative functions on $[0, \infty)$ with $\lambda(0)=\mu(0)=0$ and let $\omega, \kappa$ be increasing functions on $[\alpha, \beta]$ with

$$
\omega(\beta)-\omega(\alpha) \leqslant A \quad \text { and } \quad \kappa(\beta)-\kappa(\alpha) \leqslant B
$$

Lemma 2.1. For $p=0,1,2, \ldots$, there exists $E_{p}=\left\{x_{1}, x_{2}, \ldots, x_{n_{p}}\right\} \subset[\alpha, \beta]$ such that for any $\xi, \eta \in\left(x_{i}, x_{i+1}\right), i=1,2, \ldots, n_{p}-1$, we have

$$
|\omega(\eta)-\omega(\xi)| \leqslant A 2^{-p}
$$

and

$$
|\kappa(\eta)-\kappa(\xi)| \leqslant B 2^{-p}
$$

Furthermore, $E_{q} \supseteq E_{p}$ if $p \leqslant q$, $\#\left(E_{p}\right) \leqslant 2^{p+1}$ and $\#\left(E_{p+1} \backslash E_{p}\right) \leqslant 2^{p+1}$, where $\#\left(E_{p}\right)$ denotes the number of elements in the set $E_{p}$.

Proof. Denote $|\omega(\xi)-\omega(\eta)|,|\kappa(\xi)-\kappa(\eta)|$ by $\omega(\xi, \eta), \kappa(\xi, \eta)$ respectively.
Let $E_{0}^{\omega}=\left\{x_{1}^{(0)}, x_{2}^{(0)}\right\}$, where $x_{1}^{(0)}=\alpha, x_{2}^{(0)}=\beta$. Then for any $\xi, \eta \in\left(x_{1}^{(0)}, x_{2}^{(0)}\right)$, we can see that

$$
\omega(\xi, \eta) \leqslant A
$$

Let $x_{1^{\prime}}^{(0)}=\sup \left\{x \in\left[x_{1}^{(0)}, x_{2}^{(0)}\right] ; \omega(\xi, \eta) \leqslant A 2^{-1}\right.$ for any $\left.\xi, \eta \in\left(x_{1}^{(0)}, x\right)\right\}$ and let

$$
E_{1}^{\omega}=\left\{x_{1}^{(0)}, x_{1^{\prime}}^{(0)}, x_{2}^{(0)}\right\}
$$

It is possible that $x_{1^{\prime}}^{(0)}=x_{2}^{(0)}$, i.e., $E_{1}^{\omega}=E_{0}^{\omega}$. We may assume that the above supremum is well-defined, otherwise we use $\left(x, x_{2}^{(0)}\right)$ instead of $\left(x_{1}^{(0)}, x\right)$. We will rename points in $E_{1}^{\omega}$ according to their order using the notation

$$
E_{1}^{\omega}=\left\{x_{1}^{(1)}, x_{2}^{(1)}, x_{3}^{(1)}\right\}
$$

We claim that for any $\xi, \eta \in\left(x_{2}^{(1)}, x_{3}^{(1)}\right), \omega(\xi, \eta) \leqslant A 2^{-1}$.
Suppose that there exist $\xi, \eta \in\left(x_{2}^{(1)}, x_{3}^{(1)}\right)$ such that $\omega(\xi, \eta)>A 2^{-1}$. Since $\xi>$ $x_{2}^{(1)}$, there exists a point $\beta \in\left(x_{1}^{(1)}, x_{2}^{(1)}\right)$ such that $\omega(\beta, \xi)>A 2^{-1}$. Since $\xi>x_{2}^{(1)}$,

$$
\omega(\beta, \eta)=\omega(\beta, \xi)+\omega(\xi, \eta)>A 2^{-1}+A 2^{-1}=A
$$

It contradicts the definition of $E_{0}^{\omega}$. Hence, for any $\xi, \eta \in\left(x_{2}^{(1)}, x_{3}^{(1)}\right)$,

$$
\omega(\xi, \eta) \leqslant A 2^{-1}
$$

That is, for any $\xi, \eta \in\left(x_{i}^{(1)}, x_{i+1}^{(1)}\right), i=1,2$, we have

$$
\omega(\xi, \eta) \leqslant A 2^{-1}
$$

Let $x_{1^{\prime}}^{(1)}=\sup \left\{x \in\left[x_{1}^{(1)}, x_{2}^{(1)}\right] ; \omega(\xi, \eta) \leqslant A 2^{-2}\right.$ for every $\left.\xi, \eta \in\left(x_{1}^{(1)}, x\right)\right\}, x_{2^{\prime}}^{(1)}=$ $\sup \left\{x \in\left[x_{2}^{(1)}, x_{3}^{(1)}\right] ; \omega(\xi, \eta) \leqslant A 2^{-2}\right.$ for every $\left.\xi, \eta \in\left(x_{2}^{(1)}, x\right)\right\}$ and

$$
E_{2}^{\omega}=\left\{x_{1}^{(1)}, x_{1^{\prime}}^{(1)}, x_{2}^{(1)}, x_{2^{\prime}}^{(1)}, x_{3}^{(1)}\right\}
$$

It is still possible that $x_{1^{\prime}}^{(1)}=x_{2}^{(1)}$ or $x_{2^{\prime}}^{(1)}=x_{3}^{(1)}$. We again rename $E_{2}^{\omega}$ according to their order by

$$
E_{2}^{\omega}=\left\{x_{1}^{(2)}, x_{2}^{(2)}, x_{3}^{(2)}, x_{4}^{(2)}, x_{5}^{(2)}\right\}
$$

Using the same argument as above, we also have for any $\xi, \eta \in\left(x_{i}^{(2)}, x_{i+1}^{(2)}\right)$ and for every $i=1,2,3,4$,

$$
\omega(\xi, \eta) \leqslant A 2^{-2}
$$

Using this method, we can have $E_{p}^{\omega}=\left\{x_{1}^{(p)}, x_{2}^{(p)}, \ldots, x_{n_{p}}^{(p)}\right\}, p=0,1,2, \ldots$, such that for any $\xi, \eta \in\left(x_{i}^{(p)}, x_{i+1}^{(p)}\right), i=1,2, \ldots, n_{p}-1$, we have

$$
\omega(\xi, \eta) \leqslant A 2^{-p}
$$

We can also see that $E_{q}^{\omega} \subseteq E_{p}^{\omega}$ whenever $q \leqslant p$, the number of elements in $E_{p}^{\omega}$ is at most $2^{p}+1$ and the number of elements in $E_{p+1}^{\omega} \backslash E_{p}^{\omega}$ is at most $2^{p}$.

Using the same argument, we also can define $E_{p}^{\kappa}=\left\{y_{1}^{(p)}, y_{2}^{(p)}, \ldots, y_{m_{p}}^{(p)}\right\}$ for $p=$ $0,1,2, \ldots$, so that for any $\xi, \eta \in\left(y_{i}^{(p)}, y_{i+1}^{(p)}\right), i=1,2, \ldots, m_{p}-1$, we have

$$
\kappa(\xi, \eta) \leqslant B 2^{-p}
$$

Furthermore, $E_{q}^{\kappa} \subseteq E_{p}^{\kappa}$ whenever $q \leqslant p$, the number of elements in $E_{p}^{\kappa}$ is at most $2^{p}+1$ and the number of element in $E_{p+1}^{\kappa} \backslash E_{p}^{\kappa}$ is at most $2^{p}$.

Now, let $E_{p}=E_{p}^{\omega} \cup E_{p}^{\kappa}=\left\{z_{1}^{(p)}, z_{2}^{(p)}, \ldots, z_{r_{p}}^{(p)}\right\}$. Then for every $\xi, \eta \in\left(z_{i}^{(p)}, z_{i+1}^{(p)}\right)$, $i=1,2, \ldots, r_{p}-1$,

$$
\omega(\xi, \eta) \leqslant A 2^{-p} \text { and } \kappa(\xi, \eta) \leqslant B 2^{-p}
$$

Furthermore, $E_{q} \subseteq E_{p}$ whenever $q \leqslant p$, the number of elements in $E_{p+1} \backslash E_{p}$ is at most $2 \cdot 2^{p}=2^{p+1}$ and number of elements in $E_{p}$ is at most $2\left(2^{p}+1\right)-2=2^{p+1}$, since $\alpha, \beta \in E_{p}^{\omega} \cap E_{p}^{\kappa}$.

Lemma 2.2. (i) For any positive integer $v$, the following inequalities hold:

$$
\sum_{n=0}^{\infty} 2^{n+v} \lambda\left(A 2^{-(n+v)}\right) \mu\left(B 2^{-(n+v)}\right) \leqslant 2 \sum_{n=2^{v-1}}^{\infty} \lambda\left(\frac{A}{n}\right) \mu\left(\frac{B}{n}\right)
$$

and

$$
\sum_{n=1}^{\infty} \lambda\left(\frac{A 2^{-v}}{n}\right) \mu\left(\frac{B 2^{-v}}{n}\right) \leqslant \frac{1}{2^{v-1}} \sum_{n=2^{v-1}}^{\infty} \lambda\left(\frac{A}{n}\right) \mu\left(\frac{B}{n}\right)
$$

(ii)

$$
\sum_{n=0}^{\infty} 2^{n} \lambda\left(A 2^{-n}\right) \mu\left(B 2^{-n}\right) \leqslant 3 \sum_{n=1}^{\infty} \lambda\left(\frac{A}{n}\right) \mu\left(\frac{B}{n}\right)
$$

Proof. (i)

$$
\begin{aligned}
& \sum_{n=0}^{\infty} 2^{n+v} \lambda\left(A 2^{-(n+v)}\right) \mu\left(B 2^{-(n+v)}\right)=\sum_{k=v}^{\infty} 2^{k} \lambda\left(A 2^{-k}\right) \mu\left(B 2^{-k}\right) \\
& \quad \leqslant 2 \sum_{k=v}^{\infty} \sum_{n=2^{k-1}+1}^{2^{k}} \lambda\left(\frac{A}{n}\right) \mu\left(\frac{B}{n}\right)=2 \sum_{n=2^{v-1}+1}^{\infty} \lambda\left(\frac{A}{n}\right) \mu\left(\frac{B}{n}\right) \\
& \quad \leqslant 2 \sum_{n=2^{v-1}}^{\infty} \lambda\left(\frac{A}{n}\right) \mu\left(\frac{B}{n}\right) .
\end{aligned}
$$

Similarly, we have

$$
\begin{aligned}
\sum_{n=1}^{\infty} & \lambda\left(\frac{A 2^{-v}}{n}\right) \mu\left(\frac{B 2^{-v}}{n}\right)=\sum_{n=0}^{\infty} \sum_{k=2^{n}}^{2^{n+1}-1} \lambda\left(\frac{A 2^{-v}}{k}\right) \mu\left(\frac{B 2^{-v}}{k}\right) \\
& \leqslant \sum_{n=0}^{\infty} 2^{n} \lambda\left(A 2^{-(v+n)}\right) \mu\left(B 2^{-(v+n)}\right)=\frac{1}{2^{v}} \sum_{n=0}^{\infty} 2^{n+v} \lambda\left(A 2^{-(n+v)}\right) \mu\left(B 2^{-(n+v)}\right) \\
& \leqslant \frac{1}{2^{v-1}} \sum_{n=2^{v-1}}^{\infty} \lambda\left(\frac{A}{n}\right) \mu\left(\frac{B}{n}\right) .
\end{aligned}
$$

(ii) As in the first part of (i),

$$
\begin{gathered}
\sum_{n=0}^{\infty} 2^{n} \lambda\left(A 2^{-n}\right) \mu\left(B 2^{-n}\right)=\lambda(A) \mu(B)+\sum_{k=1}^{\infty} 2^{k} \lambda\left(A 2^{-k}\right) \mu\left(B 2^{-k}\right) \\
\leqslant \lambda(A) \mu(B)+2 \sum_{n=1}^{\infty} \lambda\left(\frac{A}{n}\right) \mu\left(\frac{B}{n}\right) \leqslant 3 \sum_{n=1}^{\infty} \lambda\left(\frac{A}{n}\right) \mu\left(\frac{B}{n}\right) .
\end{gathered}
$$

## Lemma 2.3.

$$
\sum_{n=1}^{\infty} \lambda\left(\frac{1}{n}\right) \mu\left(\frac{1}{n}\right)<\infty \text { if and only if } \sum_{n=1}^{\infty} \lambda\left(\frac{A}{n}\right) \mu\left(\frac{B}{n}\right)<\infty
$$

Proof. Suppose $\sum_{n=1}^{\infty} \lambda(1 / n) \mu(1 / n)<\infty$. Let $m$ be a positive integer such that $A \leqslant m$ and $B \leqslant m$. Then

$$
\begin{aligned}
\sum_{n=1}^{\infty} \lambda\left(\frac{A}{n}\right) \mu\left(\frac{B}{n}\right) & =\sum_{n=1}^{m-1} \lambda\left(\frac{A}{n}\right) \mu\left(\frac{B}{n}\right)+\sum_{n=m}^{\infty} \lambda\left(\frac{A}{n}\right) \mu\left(\frac{B}{n}\right) \\
& =\sum_{n=1}^{m-1} \lambda\left(\frac{A}{n}\right) \mu\left(\frac{B}{n}\right)+\sum_{k=1}^{\infty} \sum_{n=k m}^{(k+1) m} \lambda\left(\frac{A}{n}\right) \mu\left(\frac{B}{n}\right) \\
& \leqslant \sum_{n=1}^{m-1} \lambda\left(\frac{A}{n}\right) \mu\left(\frac{B}{n}\right)+m \sum_{k=1}^{\infty} \lambda\left(\frac{1}{k}\right) \mu\left(\frac{1}{k}\right)<\infty
\end{aligned}
$$

Conversely, suppose $\sum_{n=1}^{\infty} \lambda(A / n) \mu(B / n)<\infty$. Let $\lambda^{\prime}(x)=\lambda(A x), \mu^{\prime}(x)=\mu(B x)$. Then $\sum_{n=1}^{\infty} \lambda^{\prime}(1 / n) \mu^{\prime}(1 / n)<\infty$. Therefore, $\sum_{n=1}^{\infty} \lambda^{\prime}(1 /(A n)) \mu^{\prime}(1 /(B n))<\infty$. Consequently, $\sum_{n=1}^{\infty} \lambda(1 / n) \mu(1 / n)<\infty$.

## 3. Integrals of step functions

In this section we shall present Young's results on integrals of step functions, see [12]. Let $g$ be a regulated function on $[\alpha, \beta]$ and $s$ a step function on $[\alpha, \beta]$ with

$$
s(x)=\sum_{i=1}^{q} c_{i} \chi_{\left(t_{i}, t_{i+1}\right)}(x)+\sum_{i=1}^{q+1} d_{i} \chi_{\left\{t_{i}\right\}}(x),
$$

where $\chi_{G}$ is the characteristic function of $G$, and $\alpha=t_{1}<t_{2}<\ldots<t_{q+1}=\beta$.
It is known, see [1], that

$$
\int_{\alpha}^{\beta} s \mathrm{~d} g=\sum_{i=1}^{q} c_{i}\left(g\left(t_{i+1}-\right)-g\left(t_{i}+\right)\right)+\sum_{i=1}^{q+1} d_{i}\left(g\left(t_{i}+\right)-g\left(t_{i}-\right)\right) .
$$

Furthermore, we always assume that the following conditions hold:

$$
\left\{\begin{array}{l}
|s(\xi)-s(\eta)| \leqslant \lambda(\omega(\xi)-\omega(\eta))  \tag{1}\\
|g(\xi)-g(\eta)| \leqslant \mu(\kappa(\xi)-\kappa(\eta))
\end{array}\right.
$$

for any $\xi, \eta \in[\alpha, \beta]$ with $\xi>\eta$, where $\lambda, \mu, \omega, \kappa$ are given in Section 1. In this section we always assume that $\sum_{n=1}^{\infty} \lambda(A / n) \mu(B / n)<\infty$. Recall that $\omega(\beta)-\omega(\alpha) \leqslant A$ and $\kappa(\beta)-\kappa(\alpha) \leqslant B$.

Definition 3.1. Let $s$ be a step function defined on $[\alpha, \beta]$ and $E_{p}$ the finite set as defined in Lemma 2.1. Let $E=\left\{x_{i}: i=1,2, \ldots, m+1\right\}$ be any fixed finite set containing $E_{0}$. We define $s_{E}$ to be the step function induced by $s$ and $E$ as follows:

$$
s_{E}(x)=\sum_{i=1}^{m} s\left(x_{i}+\right) \chi_{\left(x_{i}, x_{i+1}\right)}(x)+\sum_{i=1}^{m+1} s\left(x_{i}\right) \chi_{\left\{x_{i}\right\}}(x) .
$$

We have, by the formula for the value of the integral of a step function with respect to $g$ presented above,

$$
\int_{\alpha}^{\beta} s_{E} \mathrm{~d} g=\sum_{i=1}^{m} s\left(x_{i}+\right)\left(g\left(x_{i+1}-\right)-g\left(x_{i}+\right)\right)+\sum_{i=1}^{m+1} s\left(x_{i}\right)\left(g\left(x_{i}+\right)-g\left(x_{i}-\right)\right) .
$$

We remark that if $E$ contains all points of discontinuity of $s$, then $s_{E}=s$ and $\int_{\alpha}^{\beta} s_{E} \mathrm{~d} g=\int_{\alpha}^{\beta} s \mathrm{~d} g$.

Lemma 3.2. Let $E \supseteq E_{0}$. Then

$$
\left|\int_{\alpha}^{\beta}\left(s_{E \cup E_{p}}-s_{E_{p}}\right) \mathrm{d} g\right| \leqslant N_{p} \lambda\left(\frac{A}{2^{p}}\right) \mu\left(\frac{B}{2^{p}}\right)
$$

where $N_{p}=\#\left(E \backslash E_{p}\right)$. Furthermore,

$$
\lim _{p \rightarrow \infty}\left|\int_{\alpha}^{\beta}\left(s_{E \cup E_{p}}-s_{E_{p}}\right) \mathrm{d} g\right|=0 .
$$

Proof. Let $N_{p}$ denote $\#\left(E \backslash E_{p}\right)$. Let $s^{\prime}$ denote the step function $s_{E \cup E_{p}}-s_{E_{p}}$. Suppose $s^{\prime}$ is induced by a partition $\left\{\left[y_{i}, y_{i+1}\right]\right\}_{i=1}^{m}$ of $[\alpha, \beta]$. If $y_{i} \in E_{p}$, then $s^{\prime}$ has zero values over a half-open subinterval $\left[y_{i}, y_{i+1}\right)$. Therefore, the number of subintervals where $s^{\prime}$ has nonzero value is at most $N_{p}$. Then

$$
\left|\int_{\alpha}^{\beta}\left(s_{E \cup E_{p}}-s_{E_{p}}\right) \mathrm{d} g\right| \leqslant N_{p} \lambda\left(A 2^{-p}\right) \mu\left(B 2^{-p}\right) \leqslant N_{0} \lambda\left(A 2^{-p}\right) \mu\left(B 2^{-p}\right)
$$

Hence, for any fixed finite set $E$,

$$
\lim _{p \rightarrow \infty}\left|\int_{\alpha}^{\beta}\left(s_{E \cup E_{p}}-s_{E_{p}}\right) \mathrm{d} g\right| \leqslant \lim _{p \rightarrow \infty} N_{0} \lambda\left(A 2^{-p}\right) \mu\left(B 2^{-p}\right)=0 .
$$

In the above, we use the fact that $\lambda, \mu$ are continuous at 0 and $\lambda(0)=\mu(0)=0$.

Theorem 3.3. Let $s$ be a step function and $E_{0}$ as above. Then

$$
\left|\int_{\alpha}^{\beta}\left(s-s_{E_{0}}\right) \mathrm{d} g\right| \leqslant 6 \sum_{n=1}^{\infty} \lambda\left(\frac{A}{n}\right) \mu\left(\frac{B}{n}\right) .
$$

Proof. From Lemma 3.2, $E_{p+1}=E_{p+1} \cup E_{p}$ and $\#\left(E_{p+1}-E_{p}\right) \leqslant 2^{p+1}$, we have

$$
\begin{aligned}
\left|\int_{\alpha}^{\beta}\left(s_{E_{p+1}}-s_{E_{p}}\right) \mathrm{d} g\right| & =\left|\int_{\alpha}^{\beta}\left(s_{E_{p+1} \cup E_{p}}-s_{E_{p}}\right) \mathrm{d} g\right| \\
& \leqslant 2^{p+1} \lambda\left(A 2^{-p}\right) \mu\left(A 2^{-p}\right)=2 \cdot 2^{p} \lambda\left(A 2^{-p}\right) \mu\left(A 2^{-p}\right)
\end{aligned}
$$

Now, let $E^{*}$ be a finite set containing $E_{0}$ and all points of discontinuity of $s$, then $\int_{\alpha}^{\beta} s \mathrm{~d} g=\int_{\alpha}^{\beta} s_{E^{*}} \mathrm{~d} g=\int_{\alpha}^{\beta} s_{E^{*} \cup E_{v}} \mathrm{~d} g$ for all $v=0,1,2, \ldots$. Hence we have

$$
\begin{aligned}
\left|\int_{\alpha}^{\beta}\left(s-s_{E_{p}}\right) \mathrm{d} g\right| \leqslant & \lim _{q \rightarrow \infty}\left(\left|\int_{\alpha}^{\beta}\left(s_{E^{*}}-s_{E_{p+q}}\right) \mathrm{d} g\right|+\left|\int_{\alpha}^{\beta}\left(s_{E_{p+q}}-s_{E_{p+q-1}}\right) \mathrm{d} g\right|\right. \\
& \left.+\ldots+\left|\int_{\alpha}^{\beta}\left(s_{E_{p+1}}-s_{E_{p}}\right) \mathrm{d} g\right|\right) \\
= & \lim _{q \rightarrow \infty}\left(\left|\int_{\alpha}^{\beta}\left(s_{E^{*} \cup E_{p+q}}-s_{E_{p+q}}\right) \mathrm{d} g\right|+\left|\int_{\alpha}^{\beta}\left(s_{E_{p+q}}-s_{E_{p+q-1}}\right) \mathrm{d} g\right|\right. \\
& \left.+\ldots+\left|\int_{\alpha}^{\beta}\left(s_{E_{p+1}}-s_{E_{p}}\right) \mathrm{d} g\right|\right) \\
\leqslant & 0+\lim _{q \rightarrow \infty} \sum_{m=0}^{q-1} 2 \cdot 2^{p+m} \lambda\left(A 2^{-(p+m)}\right) \mu\left(A 2^{-(p+m)}\right) \\
\leqslant & 4 \sum_{n=2^{p-1}}^{\infty} \lambda\left(\frac{A}{n}\right) \mu\left(\frac{B}{n}\right) \text { for } p=1,2, \ldots
\end{aligned}
$$

The last inequality holds by Lemma 2.2 (i).
When $p=0$, by Lemma 2.2 (ii) we get

$$
\left|\int_{\alpha}^{\beta}\left(s-s_{E_{0}}\right) \mathrm{d} g\right| \leqslant 6 \sum_{n=1}^{\infty} \lambda\left(\frac{A}{n}\right) \mu\left(\frac{B}{n}\right) .
$$

Corollary 3.4. Suppose that $s_{1}(x)=\sum_{i=1}^{n} d_{i} \chi_{\left[u_{i}, u_{i+1}\right)}(x)+d_{n} \chi_{\left\{u_{n+1}\right\}}(x), s_{2}(x)=$ $\sum_{i=1}^{m} e_{i} \chi_{\left[v_{i}, v_{i+1}\right)}(x)+e_{m} \chi_{\left\{v_{m+1}\right\}}(x)$ are step functions defined on $[\alpha, \beta]$. Let (1) hold with $s=s_{1}, s_{2}$ and $\left|d_{1}-e_{1}\right| \leqslant \lambda(A)$. Then

$$
\left|\sum_{i=1}^{n} d_{i}\left(g\left(u_{i+1}\right)-g\left(u_{i}\right)\right)-\sum_{i=1}^{m} e_{i}\left(g\left(v_{i+1}\right)-g\left(v_{i}\right)\right)\right| \leqslant 13 \sum_{n=1}^{\infty} \lambda\left(\frac{A}{n}\right) \mu\left(\frac{B}{n}\right) .
$$

Proof. First we shall prove that the following inequality holds:

$$
\begin{equation*}
\left|\sum_{i=1}^{n} d_{i}\left(g\left(u_{i+1}\right)-g\left(u_{i}\right)\right)-d_{1}(g(\beta)-g(\alpha))\right| \leqslant 6 \sum_{n=1}^{\infty} \lambda\left(\frac{A}{n}\right) \mu\left(\frac{B}{n}\right) . \tag{2}
\end{equation*}
$$

Let $g^{*}\left(u_{i}\right)=g\left(u_{i}\right), g^{*}(t)=g\left(u_{i}\right)$ for those $t$ close to $u_{i}$ from the left, otherwise, let $g^{*}(t)=g(t)$. Then $g^{*}\left(u_{i}-\right)=g^{*}\left(u_{i}\right)$ and $g^{*}$ also satisfies $\left|g^{*}(\xi)-g^{*}(\eta)\right| \leqslant$ $\mu(|\kappa(\xi)-\kappa(\eta)|)$ for any $\xi, \eta \in[\alpha, \beta]$. Then

$$
\begin{aligned}
\int_{\alpha}^{\beta} s_{1} \mathrm{~d} g^{*} & =\sum_{i=1}^{n} d_{i}\left(g^{*}\left(u_{i+1}-\right)-g^{*}\left(u_{i}\right)\right)+d_{n}\left(g^{*}\left(u_{n+1}\right)-g^{*}\left(u_{n+1}-\right)\right) \\
& =\sum_{i=1}^{n} d_{i}\left(g^{*}\left(u_{i+1}-\right)-g^{*}\left(u_{i}\right)\right)=\sum_{i=1}^{n} d_{i}\left(g\left(u_{i+1}\right)-g\left(u_{i}\right)\right)
\end{aligned}
$$

Applying Theorem 3.3 to $s=s_{1}$ and $g=g^{*}, \int_{\alpha}^{\beta} s_{E_{0}} \mathrm{~d} g^{*}=d_{1}\left(g^{*}(\beta-)-g^{*}(\alpha)\right)+$ $d_{n}\left(g^{*}(\beta)-g^{*}(\beta+)\right)=d_{1}(g(\beta)-g(\alpha))$, we get the inequality (2).

Thus

$$
\begin{aligned}
& \left|\sum_{i=1}^{n} d_{i}\left(g\left(u_{i+1}\right)-g\left(u_{i}\right)\right)-\sum_{i=1}^{m} e_{i}\left(g\left(v_{i+1}\right)-g\left(v_{i}\right)\right)\right| \\
& \quad \leqslant 12 \sum_{n=1}^{\infty} \lambda\left(\frac{A}{n}\right) \mu\left(\frac{B}{n}\right)+\left|d_{1}\left(g\left(\beta_{1}\right)-g\left(\alpha_{1}\right)\right)-e_{1}\left(g\left(\beta_{1}\right)-g\left(\alpha_{1}\right)\right)\right| \\
& \quad \leqslant 12 \sum_{n=1}^{\infty} \lambda\left(\frac{A}{n}\right) \mu\left(\frac{B}{n}\right)+\left|d_{1}-e_{1}\right|\left|g\left(\beta_{1}\right)-g\left(\alpha_{1}\right)\right| \\
& \quad \leqslant 12 \sum_{n=1}^{\infty} \lambda\left(\frac{A}{n}\right) \mu\left(\frac{B}{n}\right)+\lambda(A) \mu(B)=13 \sum_{n=1}^{\infty} \lambda\left(\frac{A}{n}\right) \mu\left(\frac{B}{n}\right)
\end{aligned}
$$

## 4. Integrable functions

Now we shall introduce $\mathrm{BV}_{\varphi}[a, b]$, which is a generalization of $\mathrm{BV}[a, b]$, the space of functions of bounded variation on $[a, b]$, and prove an existence theorem (Theorem 4.6) in the Henstock-Kurzweil setting.

Definition 4.1. A function $\varphi:[0, \infty) \rightarrow \mathbb{R}$ is said to be an $N$-function if

1. $\varphi(0)=0$;
2. $\varphi$ is continuous on $[0, \infty)$;
3. $\varphi$ is strictly increasing and
4. $\varphi(u) \rightarrow \infty$ as $u \rightarrow \infty$.

Examples of $N$-functions are $\varphi_{1}(u)=u^{p}, p \geqslant 1$ and $\varphi_{2}(u)=\mathrm{e}^{u}-1$.
Definition 4.2. Let $\varphi:[0, \infty) \rightarrow \mathbb{R}$ be an $N$-function and $f:[a, b] \rightarrow \mathbb{R}$. We define

$$
V_{\varphi}(f ;[a, b])=\sup \sum_{i=1}^{n} \varphi\left(\left|f\left(x_{i+1}\right)-f\left(x_{i}\right)\right|\right)
$$

where supremum is taken over all partitions $\left\{\left[x_{i}, x_{i+1}\right]\right\}_{i=1}^{n}$ of $[a, b]$. The number $V_{\varphi}(f ;[a, b])$ is called the $\varphi$-variation of $f$ on $[a, b]$. Let $\mathrm{BV}_{\varphi}[a, b]$ denote the collection of all functions $f:[a, b] \rightarrow \mathbb{R}$ satisfying $V_{\varphi}(f ;[a, b])<\infty$, see [5], [6], [12]. Such functions are said to be of bounded $\varphi$-variation. When it is clear that we are considering the interval $[a, b]$, we shall denote $V_{\varphi}(f ;[a, b])$ by $V_{\varphi}(f)$.

For example, where $\varphi(u)=u^{p}, p \geqslant 1, \mathrm{BV}_{\varphi}[a, b]$ is the space of functions of bounded $p$-variation on $[a, b]$.

The following lemma and its proof are known.
Lemma 4.3. If $f \in \mathrm{BV}_{\varphi}[a, b]$, then $f$ is bounded on $[a, b]$ and $f$ is a regulated function.

Proof. Suppose $f$ is unbounded. Let $M$ be any positive real number. Then there exists $x \in[a, b]$ such that $M \leqslant|f(x)-f(a)|$. Hence

$$
\begin{aligned}
M & \leqslant|f(x)-f(a)|=\varphi^{-1}(\varphi(|f(x)-f(a)|)) \\
& \leqslant \varphi^{-1}(\varphi(|f(x)-f(a)|)+\varphi(|f(b)-f(x)|)) \leqslant \varphi^{-1}\left(V_{\varphi}(f ;[a, b])\right)
\end{aligned}
$$

Therefore

$$
\varphi(M) \leqslant V_{\varphi}(f ;[a, b]) \text { for all } M>0
$$

Since $\varphi(M) \rightarrow \infty$ as $M \rightarrow \infty$, we have $V_{\varphi}(f ;[a, b])=\infty$. This leads to a contradiction.

The proof that $f$ is regulated is standard.

Lemma 4.4. Let $g \in \mathrm{BV}_{\psi}[a, b], E=\left\{x_{1}, x_{2}, \ldots, x_{n}\right\} \supseteq E_{0}$, and $\varepsilon>0$, where $E_{0}$ is given in Lemma 2.1. Then there exists a constant $\delta>0$ such that for any finite collection of disjoint subintervals $\left\{\left[u_{i}, v_{i}\right]\right\}_{i=1}^{n}$ with $\left[u_{i}, v_{i}\right] \subset\left(x_{i}, x_{i}+\delta\right)$ or $\left[u_{i}, v_{i}\right] \subset\left(x_{i}-\delta, x_{i}\right)$ for each $i$, we have

$$
\sum_{i=1}^{n}\left|g\left(v_{i}\right)-g\left(u_{i}\right)\right| \leqslant \varepsilon
$$

Proof. Let $\varepsilon>0$ be given. First, since $g$ is a regulated function, there exists a constant $\delta>0$ such that

$$
\left|g(t)-g\left(x_{i}-\right)\right| \leqslant \frac{\varepsilon}{2 n} \quad \text { whenever } \quad 0<x_{i}-t<\delta
$$

and

$$
\left|g\left(x_{i}+\right)-g(t)\right| \leqslant \frac{\varepsilon}{2 n} \quad \text { whenever } \quad 0<t-x_{i}<\delta
$$

for each $i$. Therefore, we get the required result.
Next, we shall prove Lemma 4.5 using Lemma 2.2 and Corollary 3.4. We need the following notation.

Let $A \geqslant V_{\varphi}(f)$ and $B \geqslant V_{\psi}(g)$. Define $\omega(x)=V_{\varphi}(f ;[a, x])$ and $\kappa(x)=$ $V_{\psi}(g ;[a, x])$. Let $\lambda=\varphi^{-1}, \mu=\psi^{-1}$. Hence, for any $\xi, \eta \in[a, b]$ with $\eta>\xi$,

$$
\lambda(\omega(\eta)-\omega(\xi))=\varphi^{-1}(\omega(\eta)-\omega(\xi)) \geqslant|f(\eta)-f(\xi)| .
$$

Similarly, $\mu(\kappa(\eta)-\kappa(\xi)) \geqslant|g(\eta)-g(\xi)|$.
Let $E_{v}=\left\{x_{1}, x_{2}, \ldots, x_{n_{v}}\right\}$ be given as in Lemma 2.1 with $v \geqslant 1$ and $[\alpha, \beta]=[a, b]$. Then $\#\left(E_{v}\right) \leqslant 2^{v+1}$. Furthermore,

$$
|f(\eta)-f(\xi)| \leqslant \lambda(\omega(\eta)-\omega(\xi)) \leqslant \lambda\left(A 2^{-v}\right)=\varphi^{-1}\left(A 2^{-v}\right)
$$

and

$$
|g(\eta)-g(\xi)| \leqslant \mu(\kappa(\eta)-\kappa(\xi)) \leqslant \mu\left(B 2^{-v}\right)=\psi^{-1}\left(B 2^{-v}\right)
$$

for any $\eta, \xi \in\left(x_{k}, x_{k+1}\right)$ with $\eta>\xi, k=1,2, \ldots, n_{v}-1$. The above is equivalent to (1) mentioned before Definition 3.1.

From now onwards, a division $D=\left\{\left(\xi_{i},\left[u_{i}, v_{i}\right]\right)\right\}_{i=1}^{n}$ is always denoted by $D=$ $\{(\xi,[u, v])\}$.

Lemma 4.5. Let $f \in \operatorname{BV}_{\varphi}[a, b]$ and $g \in \operatorname{BV}_{\psi}[a, b]$ with $\sum_{n=1}^{\infty} \varphi^{-1}(1 / n) \psi^{-1}(1 / n)<$ $\infty$. Let $v \geqslant 1$ be fixed and $E_{v}=\left\{x_{1}, x_{2}, \ldots, x_{n_{v}}\right\}$ given as above. Suppose $D=\{(\xi,[u, v])\}$ and $D^{\prime}=\left\{\left(\xi^{\prime},\left[u^{\prime}, v^{\prime}\right]\right)\right\}$ are two partial divisions of $[a, b]$ such that $\bigcup[u, v]=\bigcup\left[u^{\prime}, v^{\prime}\right]$ and $[u, v] \subset\left(x_{k}, x_{k+1}\right),\left[u^{\prime}, v^{\prime}\right] \subset\left(x_{k}, x_{k+1}\right)$. Then for any $\xi \in[u, v], \xi^{\prime} \in\left[u^{\prime}, v^{\prime}\right]$, we have

$$
\begin{aligned}
\mid(D) \sum f(\xi)(g(v)-g(u))-\left(D^{\prime}\right) \sum f\left(\xi^{\prime}\right) & \left(g\left(v^{\prime}\right)-g\left(u^{\prime}\right)\right) \mid \\
& \leqslant 52 \sum_{n=2^{v-1}}^{\infty} \varphi^{-1}\left(\frac{A}{n}\right) \psi^{-1}\left(\frac{B}{n}\right)
\end{aligned}
$$

where $v \geqslant 1$.
Proof. Let $D_{k}=\left\{(\xi,[u, v]) \in D ;[u, v] \subseteq\left(x_{k}, x_{k+1}\right)\right\}$ and $D_{k}^{\prime}=\left\{\left(\xi^{\prime},\left[u^{\prime}, v^{\prime}\right]\right) \in\right.$ $\left.D^{\prime} ;\left[u^{\prime}, v^{\prime}\right] \subseteq\left(x_{k}, x_{k+1}\right)\right\}, k=1,2, \ldots, n_{v}-1$. It is clear that $\left|f(\xi)-f\left(\xi^{\prime}\right)\right|<$ $\varphi^{-1}\left(A 2^{-v}\right)$. Note that $\bigcup\left\{[u, v] ;[u, v] \subset\left(x_{k}, x_{k+1}\right)\right\}=\bigcup\left\{\left[u^{\prime}, v^{\prime}\right]:\left[u^{\prime}, v^{\prime}\right] \subset\right.$ $\left.\left(x_{k}, x_{k+1}\right)\right\}=:[\alpha, \beta]$. Applying Corollary 3.4 , for any $\xi, \xi^{\prime}$ we have

$$
\begin{aligned}
& \left|\left(D_{k}\right) \sum f(\xi)(g(v)-g(u))-\left(D_{k}^{\prime}\right) \sum f\left(\xi^{\prime}\right)\left(g\left(v^{\prime}\right)-g\left(u^{\prime}\right)\right)\right| \\
& \quad \leqslant 13 \sum_{n=1}^{\infty} \varphi^{-1}\left(\frac{A 2^{-v}}{n}\right) \psi^{-1}\left(\frac{B 2^{-v}}{n}\right)
\end{aligned}
$$

for $k=1,2, \ldots, n_{v}-1$.
Note that $D=\bigcup_{k=1}^{n_{v}-1} D_{k}$ and $n_{v} \leqslant 2^{v+1}$. Hence, by Lemma 2.2 (i),

$$
\begin{aligned}
&\left|(D) \sum f(\xi)(g(v)-g(u))-\left(D^{\prime}\right) \sum f\left(\xi^{\prime}\right)\left(g\left(v^{\prime}\right)-g\left(u^{\prime}\right)\right)\right| \\
& \leqslant 13\left(2^{v+1}-1\right) \sum_{n=1}^{\infty} \varphi^{-1}\left(\frac{A 2^{-v}}{n}\right) \psi^{-1}\left(\frac{B 2^{-v}}{n}\right) \\
& \leqslant 13\left(2^{v+1}-1\right) \frac{1}{2^{v-1}} \sum_{n=2^{v-1}}^{\infty} \varphi^{-1}\left(\frac{A}{n}\right) \psi^{-1}\left(\frac{B}{n}\right) \\
& \leqslant 52 \sum_{n=2^{v-1}}^{\infty} \varphi^{-1}\left(\frac{A}{n}\right) \psi^{-1}\left(\frac{B}{n}\right)
\end{aligned}
$$

The following existence theorem is proved in [12] by the Moore-Pollard approach. Now we will prove it by the Henstock-Kurzweil approach.

Theorem 4.6 (Existence Theorem). Let $f \in \mathrm{BV}_{\varphi}[a, b]$ and $g \in \mathrm{BV}_{\psi}[a, b]$. Suppose that $\sum_{n=1}^{\infty} \varphi^{-1}(1 / n) \psi^{-1}(1 / n)<\infty$. Then $\int_{a}^{b} f \mathrm{~d} g$ exists.

Proof. First, let $A \geqslant V_{\varphi}(f ;[a, b])$ and $B \geqslant V_{\psi}(f ;[a, b])$. Then by Lemma 2.3, $\sum_{n=1}^{\infty} \varphi^{-1}(A / n) \psi^{-1}(B / n)<\infty$.

Let $\varepsilon>0$, choose $v$ such that $\sum_{n=2^{v-1}}^{\infty} \lambda(A / n) \mu(B / n) \leqslant \varepsilon / 52$.
Let $E_{v}=\left\{x_{1}, x_{2}, \ldots, x_{n_{v}}\right\}$ be given as in Lemma 2.1. Let $\delta^{\prime}$ be given as in Lemma 4.4 with $E=E_{v}$. Let $\delta$ be a positive function defined on $[a, b]$ with $\delta(x)<\delta^{\prime}$ for all $x \in[a, b]$ such that if $D=\{(\xi,[u, v])\}$ is a $\delta$-fine division of $[a, b]$, then $[u, v] \subset$ $\left(\xi-\delta^{\prime}, \xi+\delta^{\prime}\right)$ and $\xi \in E_{v},[u, v] \subset\left(x_{k}, x_{k+1}\right)$ and $\xi \in\left(x_{k}, x_{k+1}\right), k=1,2, \ldots, n_{v}-1$. Now let $D=\{(\xi,[u, v])\}$ and $D^{\prime}=\left\{\left(\xi^{\prime},\left[u^{\prime}, v^{\prime}\right]\right)\right\}$ be two $\delta$-fine divisions of $[a, b]$. Let $D=D_{1} \cup D_{2}, D^{\prime}=D_{1}^{\prime} \cup D_{2}^{\prime}$ where $D_{1}=\left\{(\xi,[u, v]) \in D ; \xi \in E_{v}\right\}, D_{1}^{\prime}=$ $\left\{\left(\xi^{\prime},\left[u^{\prime}, v^{\prime}\right]\right) \in D ; \xi^{\prime} \in E_{v}\right\}, D_{2}=D \backslash D_{1}$ and $D_{2}^{\prime}=D^{\prime} \backslash D_{1}^{\prime}$. Suppose $(\xi,[u, v]) \in D_{2}$ and $x_{i}+\delta\left(x_{i}\right) \in[u, v]$ (or $x_{i}-\delta\left(x_{i}\right) \in[u, v]$ ). Then we divide $[u, v]$ into two parts $\left[u, x_{i}+\delta\left(x_{i}\right)\right],\left[x_{i}+\delta\left(x_{i}\right), v\right]\left(\left[u, x_{i}-\delta\left(x_{i}\right)\right],\left[x_{i}-\delta\left(x_{i}\right), v\right]\right.$, respectively $)$.

Let $\bar{D}_{1}$ be the union of $D_{1}$ and $\left(\xi,\left[u, x_{i}+\delta\left(x_{i}\right)\right]\right),\left(\xi,\left[x_{i}-\delta\left(x_{i}\right), v\right]\right)$. Let $\bar{D}_{2}=$ $D \backslash \bar{D}_{1}$. Similarly, we construct $\bar{D}^{\prime}{ }_{1}$ and $\bar{D}^{\prime}{ }_{2}=D^{\prime} \backslash \bar{D}^{\prime}{ }_{1}$.

Then, by Lemmas 4.4 and 4.5, we get

$$
\begin{aligned}
\mid(D) \sum & f(\xi)(g(v)-g(u))-\left(D^{\prime}\right) \sum f\left(\xi^{\prime}\right)\left(g\left(v^{\prime}\right)-g\left(u^{\prime}\right)\right) \mid \\
\leqslant & \left|\left(\bar{D}_{1}\right) \sum f(\xi)(g(v)-g(u))-\left(\bar{D}^{\prime}{ }_{1}\right) \sum f(\xi)(g(v)-g(u))\right| \\
& \quad+\left|\left(\bar{D}_{2}\right) \sum f(\xi)(g(v)-g(u))-\left(\bar{D}_{2}^{\prime}\right) \sum f\left(\xi^{\prime}\right)\left(g\left(v^{\prime}\right)-g\left(u^{\prime}\right)\right)\right| \\
\leqslant & 8\|f\|_{\infty} \varepsilon+\varepsilon
\end{aligned}
$$

where $\|f\|_{\infty}=\sup \{f(x) ; x \in[a, b]\}$. Thus $\int_{a}^{b} f \mathrm{~d} g$ exists.

## 5. Approximation

In this section we show that $\int_{a}^{b} f \mathrm{~d} g$ can be approximated by $\int_{a}^{b} s \mathrm{~d} g$, where $s$ is a step function. This approximation theorem can be found in [12].

Theorem 5.1. Let $f \in \mathrm{BV}_{\varphi}[a, b], g \in \mathrm{BV}_{\psi}[a, b]$ and $\sum_{n=1}^{\infty} \varphi^{-1}(1 / n) \psi^{-1}(1 / n)<$ $\infty$. Then, given any $\varepsilon>0$, there exists a step function $s$ on $[a, b]$ such that $\left|\int_{a}^{b}(f-s) \mathrm{d} g\right| \leqslant \varepsilon$.

Proof. First, let $A \geqslant V_{\varphi}(f ;[a, b])$ and $B \geqslant V_{\psi}(f ;[a, b])$. Then, by Lemma 2.3, $\sum_{n=1}^{\infty} \varphi^{-1}(A / n) \psi^{-1}(B / n)<\infty$.

Let $E_{v}=\left\{x_{1}, x_{2}, \ldots, x_{n_{v}}\right\}$ be given as in Lemma 4.5 with $v \geqslant 1$. Define

$$
s(x)=\sum_{k=1}^{n_{v}} f\left(x_{k}\right) \chi_{\left\{x_{k}\right\}}(x)+\sum_{k=1}^{n_{v}-1} f\left(x_{k}+\right) \chi_{\left(x_{k}, x_{k+1}\right)}(x) .
$$

Then $(f-s)\left(x_{k}\right)=0$ for all $x_{k} \in E_{v}$. By Theorem 4.6, $\int_{a}^{b} f \mathrm{~d} g-\int_{a}^{b} s \mathrm{~d} g=$ $\int_{a}^{b}(f-s) \mathrm{d} g$ exists. Let $\varepsilon>0$; there exists a positive function $\delta$ on $[a, b]$ such that whenever $D=\{(\xi,[u, v])\}$ is a $\delta$-fine division of $[a, b], x_{i}$ is a tag for every $i=1,2, \ldots, n_{v}$, and

$$
\left|\int_{a}^{b}(f-s) \mathrm{d} g-(D) \sum(f-s)(\xi)(g(v)-g(u))\right| \leqslant \frac{\varepsilon}{2}
$$

By Lemma 4.5, and all $x_{i}$ being tags, we have

$$
\begin{aligned}
\left|(D) \sum(f-s)(\xi)(g(v)-g(u))\right| & =\left|(D) \sum_{\xi \notin E_{v}}(f-s)(\xi)(g(v)-g(u))\right| \\
& \leqslant 52 \sum_{n=2^{v-1}}^{\infty} \lambda\left(\frac{A}{n}\right) \mu\left(\frac{B}{n}\right) \text { for } v \geqslant 1
\end{aligned}
$$

Therefore

$$
\left|\int_{a}^{b}(f-s) \mathrm{d} g\right| \leqslant \frac{\varepsilon}{2}+52 \sum_{n=2^{v-1}}^{\infty} \lambda\left(\frac{A}{n}\right) \mu\left(\frac{B}{n}\right) .
$$

Choosing $v$ big enough, we get the required result.
Corollary 5.2. Let $f \in \operatorname{BV}_{\varphi}[a, b], g \in \mathrm{BV}_{\psi}[a, b]$ and $\sum_{n=1}^{\infty} \varphi^{-1}(1 / n) \psi^{-1}(1 / n)<$ $\infty$. Then

$$
\begin{gathered}
\left|\int_{a}^{b} f \mathrm{~d} g\right| \leqslant \\
6 \sum_{n=1}^{\infty} \varphi^{-1}\left(\frac{V_{\varphi}(f)}{n}\right) \psi^{-1}\left(\frac{V_{\psi}(g)}{n}\right)+f(a)(g(a+)-g(a)) \\
+f(a+)(g(b-)-g(a+))+f(b)(g(b)-g(b-))
\end{gathered}
$$

Proof. Let $\varepsilon>0$. By Theorem 5.1 there exists a step function $s$ on $[a, b]$ such that $\left|\int_{a}^{b}(f-s) \mathrm{d} g\right| \leqslant \varepsilon$. Hence

$$
\left|\int_{a}^{b} f \mathrm{~d} g\right| \leqslant \varepsilon+\left|\int_{a}^{b} s \mathrm{~d} g\right| .
$$

By Theorem 3.3,

$$
\left|\int_{a}^{b} s \mathrm{~d} g\right| \leqslant 6 \sum_{n=1}^{\infty} \lambda\left(\frac{V_{\varphi}(f)}{n}\right) \mu\left(\frac{V_{\psi}(g)}{n}\right)+\left|\int_{a}^{b} s_{E_{0}} \mathrm{~d} g\right| .
$$

Note that $\int_{a}^{b} s_{E_{0}} \mathrm{~d} g=f(a)(g(a+)-g(a))+f(a+)(g(b-)-g(a+))+f(b)(g(b)-g(b-))$. Hence we get the required result.

## 6. Integration by parts

A general result for integration by parts in the setting of Henstock-Kurzweil integrals of Stieltjes type can be found in [10]. In this section, we will prove this result in more concrete forms.

For any partial division $D=\{(\xi,[u, v])\}$ on $[a, b]$, define

$$
\begin{aligned}
& S_{-}(f, g, D)=(D) \sum(f(\xi)-f(u))(g(\xi)-g(u)) \\
& S_{+}(f, g, D)=(D) \sum(f(v)-f(\xi))(g(v)-g(\xi))
\end{aligned}
$$

and

$$
S(f, g, D)=S_{-}(f, g, D)-S_{+}(f, g, D)
$$

We say that $S_{-}(f, g)$ exists if there exists $S^{(1)}$ such that for every $\varepsilon>0$ there exists a positive function $\delta$ on $[a, b]$ such that when $D$ is a $\delta$-fine division of $[a, b]$, we have

$$
\left|S_{-}(f, g, D)-S^{(1)}\right| \leqslant \varepsilon
$$

We then denote $S^{(1)}$ by $S_{-}(f, g)$. Similarly, we can define $S_{+}(f, g)$ and $S(f, g)$. Clearly, if two of $S_{-}(f, g), S_{+}(f, g)$ and $S(f, g)$ exist, then the third exists and

$$
S(f, g)=S_{-}(f, g)-S_{+}(f, g)
$$

Lemma 6.1. Let $f \in \mathrm{BV}_{\varphi}[a, b]$ and $g \in \mathrm{BV}_{\psi}[a, b]$ with $\sum_{n=1}^{\infty} \varphi^{-1}(1 / n) \psi^{-1}(1 / n)<$ $\infty$. Then

$$
S_{+}(f, g)=\sum_{i=1}^{\infty}\left(f\left(t_{i}+\right)-f\left(t_{i}\right)\right)\left(g\left(t_{i}+\right)-g\left(t_{i}\right)\right)
$$

and

$$
S_{-}(f, g)=\sum_{i=1}^{\infty}\left(f\left(t_{i}\right)-f\left(t_{i}-\right)\right)\left(g\left(t_{i}\right)-g\left(t_{i}-\right)\right)
$$

where $t_{i}$ are the common points of discontinuity of $f$ and $g$ and the above series converge absolutely.

Proof. Let $\varepsilon>0$, let $v$ be a positive integer such that $\sum_{n=2^{v-1}}^{\infty} \varphi^{-1}(A / n) \psi^{-1}(B / n)$ $\leqslant \varepsilon / 52$. Let $E_{v}=\left\{x_{1}, x_{2}, \ldots, x_{n_{v}}\right\}$ be given as in Lemma 2.1. $E_{v}$ may contain some points of $\left\{t_{i}\right\}_{i=1}^{\infty}$. We may assume that there exists a positive integer $N$ such that $t_{j} \notin E_{v}$ whenever $j \geqslant N$. Now take any two positive integers $m, n \geqslant N$ with $m<n$. Let $\delta$ be a positive number such that for every $i=m, m+1, \ldots, n$, if $t_{i} \in\left(x_{j}, x_{j+1}\right)$ for some $j$, then $\left(t_{i}, t_{i}+\delta\right) \subset\left(x_{j}, x_{j+1}\right)$ and $\left\{\left(t_{i}, t_{i}+\delta\right)\right\}_{i=m}^{n}$ are non-overlapping intervals. Let $\eta_{i} \in\left(t_{i}, t_{i}+\delta\right)$ for all $i=m, m+1, \ldots, n$, and $D=\left\{t_{i},\left[t_{i}, \eta_{i}\right]\right\}_{i=m}^{n}$ and $D^{\prime}=\left\{\eta_{i},\left[t_{i}, \eta_{i}\right]\right\}_{i=m}^{n}$. From the definition of $D$ and $D^{\prime}$ it is clear that $D$ and $D^{\prime}$ are partial divisions of $[a, b]$ and satisfy the condition of Theorem 4.5. Hence, we have

$$
\begin{aligned}
\mid \sum_{i=m}^{n}\left(f\left(\eta_{i}\right)\right. & \left.-f\left(t_{i}\right)\right)\left(g\left(\eta_{i}\right)-g\left(t_{i}\right)\right) \mid \\
& =\left|\left(D^{\prime}\right) \sum f\left(\eta_{i}\right)\left(g\left(\eta_{i}\right)-g\left(t_{i}\right)\right)-(D) \sum f\left(t_{i}\right)\left(g\left(\eta_{i}\right)-g\left(t_{i}\right)\right)\right| \\
& \leqslant 52 \sum_{n=2^{v-1}}^{\infty} \varphi^{-1}\left(\frac{A}{n}\right) \psi^{-1}\left(\frac{B}{n}\right) \leqslant 52 \frac{\varepsilon}{52}=\varepsilon .
\end{aligned}
$$

Then

$$
\left|\sum_{i=m}^{n}\left(f\left(t_{i}+\right)-f\left(t_{i}\right)\right)\left(g\left(t_{i}+\right)-g\left(t_{i}\right)\right)\right| \leqslant \varepsilon .
$$

Observe that $D$ and $D^{\prime}$ are partial divisions. Therefore

$$
\sum_{i=m}^{n}\left|\left(f\left(t_{i}+\right)-f\left(t_{i}\right)\right)\left(g\left(t_{i}+\right)-g\left(t_{i}\right)\right)\right| \leqslant 2 \varepsilon
$$

where $m, n \geqslant N$.
Hence $S_{+}(f, g)$ converges absolutely. Similarly, $S_{-}(f, g)$ converges absolutely.
Lemma 6.2. Let $f \in \mathrm{BV}_{\varphi}[a, b]$ and $g \in \mathrm{BV}_{\psi}[a, b], E=\left\{x_{1}, x_{2}, \ldots, x_{n}\right\} \supseteq E_{0}$, and $\varepsilon>0$. Then there exists a constant $\delta^{\prime}>0$ such that for any finite collection of disjoint subintervals $\left\{\left[u_{i}, v_{i}\right]\right\}_{i=1}^{n}$ with $\left[u_{i}, v_{i}\right] \subset\left(x_{i}, x_{i}+\delta^{\prime}\right)$ for each $i$ or $\left[u_{i}, v_{i}\right] \subset$ $\left(x_{i}-\delta^{\prime}, x_{i}\right)$ for each $i$, we have

$$
\begin{gathered}
\sum_{i=1}^{n}\left|f\left(v_{i}\right)-f\left(u_{i}\right)\right|\left|g\left(v_{i}\right)-g\left(u_{i}\right)\right| \leqslant \varepsilon \\
\sum_{i=1}^{n}\left|f\left(v_{i}\right)-f\left(u_{i}\right)\right| \leqslant \frac{\varepsilon}{V_{\psi}(B)}
\end{gathered}
$$

and

$$
\sum_{i=1}^{n}\left|g\left(v_{i}\right)-g\left(u_{i}\right)\right| \leqslant \frac{\varepsilon}{V_{\psi}(A)}
$$

Proof. The proof is similar to that of Lemma 4.4. Let $\varepsilon>0$ be given. First, observe that $f$ and $g$ are regulated functions. Therefore, there exists a constant $\delta^{\prime}>0$ such that

$$
\begin{array}{ll}
\left|g(t)-g\left(x_{i}-\right)\right| \leqslant \min \left\{\left[\frac{\varepsilon}{2 n}\right]^{\frac{1}{2}}, \frac{\varepsilon}{2 n V_{\varphi}(A)}\right\} \quad \text { whenever } 0<x_{i}-t<\delta^{\prime} \\
\left|g\left(x_{i}+\right)-g(t)\right| \leqslant \min \left\{\left[\frac{\varepsilon}{2 n}\right]^{\frac{1}{2}}, \frac{\varepsilon}{2 n V_{\varphi}(A)}\right\} \quad \text { whenever } 0<t-x_{i}<\delta^{\prime} \\
\left|f(t)-f\left(x_{i}-\right)\right| \leqslant \min \left\{\left[\frac{\varepsilon}{2 n}\right]^{\frac{1}{2}}, \frac{\varepsilon}{2 n V_{\psi}(B)}\right\} \quad \text { whenever } 0<x_{i}-t<\delta^{\prime}
\end{array}
$$

and

$$
\left|f\left(x_{i}+\right)-f(t)\right| \leqslant \min \left\{\left[\frac{\varepsilon}{2 n}\right]^{\frac{1}{2}}, \frac{\varepsilon}{2 n V_{\psi}(B)}\right\} \quad \text { whenever } 0<t-x_{i}<\delta^{\prime}
$$

for each $i$. Therefore, the required result follows.
Lemma 6.3. Let $f \in \mathrm{BV}_{\varphi}[a, b]$ and $g \in \mathrm{BV}_{\psi}[a, b]$ with $\sum_{n=1}^{\infty} \varphi^{-1}(1 / n) \psi^{-1}(1 / n)<$ $\infty$. Let $\varepsilon>0$. If $E_{v}=\left\{x_{1}, x_{2}, \ldots, x_{n_{v}}\right\}$ is the set given in Lemma 2.1 and $\left\{t_{j}\right\}_{j=1}^{m} \subseteq$ $E_{v}$, where $\left\{t_{j}\right\}_{j=1}^{m}$ are all common points of discontinuity of $f$ and $g$ such that $\sum_{n=2^{v-1}}^{\infty} \varphi^{-1}(A / n) \psi^{-1}(B / n)<\varepsilon / 312$ and $\sum_{j=m+1}^{\infty}\left|\left(f\left(t_{j}\right)-f\left(t_{j}-\right)\right)\left(g\left(t_{j}\right)-g\left(t_{j}-\right)\right)\right| \leqslant$ $\varepsilon / 6$, then there exists a positive real number $\delta^{\prime}$ such that for any $\delta^{\prime}$-fine partial division $D=\left\{\left(x_{i},\left[u_{i}, v_{i}\right]\right)\right\}_{i=1}^{n_{v}}$ of $[a, b]$ we have

$$
\left|S(f, g, D)-\left(S_{+}(f, g)-S_{-}(f, g)\right)\right| \leqslant \frac{2}{3} \varepsilon
$$

Proof. Applying Lemma 6.2 to $\varepsilon / 18$ and $E=E_{v}$, we get a positive constant $\delta^{\prime}$. Let $D=\left\{\left(x_{i},\left[u_{i}, v_{i}\right]\right)\right\}_{i=1}^{n_{v}}$, then

$$
\begin{aligned}
& S_{-}(f, g, D)=\sum_{i=1}^{n_{v}}\left(f\left(x_{i}\right)-f\left(u_{i}\right)\right)\left(g\left(x_{i}\right)-g\left(u_{i}\right)\right) \\
& =\sum_{i=1}^{n_{v}}\left[\left(f\left(x_{i}\right)-f\left(x_{i}-\right)\right)+\left(f\left(x_{i}-\right)-f\left(u_{i}\right)\right)\right]\left[\left(g\left(x_{i}\right)-g\left(x_{i}-\right)\right)+\left(g\left(x_{i}-\right)-g\left(u_{i}\right)\right)\right]
\end{aligned}
$$

$$
\begin{aligned}
= & \sum_{i=1}^{n_{v}}\left(f\left(x_{i}\right)-f\left(x_{i}-\right)\right)\left(g\left(x_{i}\right)-g\left(x_{i}-\right)\right)+\sum_{i=1}^{n_{v}}\left(f\left(x_{i}\right)-f\left(x_{i}-\right)\right)\left(g\left(x_{i}-\right)-g\left(u_{i}\right)\right) \\
& +\sum_{i=1}^{n_{v}}\left(f\left(x_{i}-\right)-f\left(u_{i}\right)\right)\left(g\left(x_{i}\right)-g\left(x_{i}-\right)\right)+\sum_{i=1}^{n_{v}}\left(f\left(x_{i}-\right)-f\left(u_{i}\right)\right)\left(g\left(x_{i}-\right)-g\left(u_{i}\right)\right) .
\end{aligned}
$$

Let $F=E_{v} \backslash\left\{t_{j}\right\}_{j=1}^{m}$, then $F$ is the set of points in $E_{v}$ which are not common points of discontinuity of $f$ and $g$. Hence

$$
\sum_{x_{i} \in F}\left(f\left(x_{i}\right)-f\left(x_{i}-\right)\right)\left(g\left(x_{i}\right)-g\left(x_{i}-\right)\right)=0
$$

Consider

$$
\begin{aligned}
\sum_{i=1}^{n_{v}} & \left(f\left(x_{i}\right)-f\left(x_{i}-\right)\right)\left(g\left(x_{i}\right)-g\left(x_{i}-\right)\right) \\
& =\sum_{x_{i} \in F}\left(f\left(x_{i}\right)-f\left(x_{i}-\right)\right)\left(g\left(x_{i}\right)-g\left(x_{i}-\right)\right)+\sum_{x_{i} \notin F}\left(f\left(x_{i}\right)-f\left(x_{i}-\right)\right)\left(g\left(x_{i}\right)-g\left(x_{i}-\right)\right) \\
& =0+\sum_{x_{i} \notin F}\left(f\left(x_{i}\right)-f\left(x_{i}-\right)\right)\left(g\left(x_{i}\right)-g\left(x_{i}-\right)\right) \\
& =\sum_{j=1}^{m}\left(f\left(t_{j}\right)-f\left(t_{j}-\right)\right)\left(g\left(t_{j}\right)-g\left(t_{j}-\right)\right)
\end{aligned}
$$

Then

$$
\begin{aligned}
& S_{-}(f, g, D)=\sum_{i=1}^{n_{v}}\left(f\left(x_{i}\right)-f\left(u_{i}\right)\right)\left(g\left(x_{i}\right)-g\left(u_{i}\right)\right) \\
& =\sum_{j=1}^{m}\left(f\left(t_{j}\right)-f\left(t_{j}-\right)\right)\left(g\left(t_{j}\right)-g\left(t_{j}-\right)\right)+\sum_{i=1}^{n_{v}}\left(f\left(x_{i}\right)-f\left(x_{i}-\right)\right)\left(g\left(x_{i}-\right)-g\left(u_{i}\right)\right) \\
& \quad+\sum_{i=1}^{n_{v}}\left(f\left(x_{i}-\right)-f\left(u_{i}\right)\right)\left(g\left(x_{i}\right)-g\left(x_{i}-\right)\right)+\sum_{i=1}^{n_{v}}\left(f\left(x_{i}-\right)-f\left(u_{i}\right)\right)\left(g\left(x_{i}-\right)-g\left(u_{i}\right)\right) .
\end{aligned}
$$

Therefore

$$
\begin{aligned}
& \left|S_{-}(f, g, D)-S_{-}(f, g)\right| \\
& =\left|\sum_{i=1}^{n_{v}}\left(f\left(x_{i}\right)-f\left(u_{i}\right)\right)\left(g\left(x_{i}\right)-g\left(u_{i}\right)\right)-\sum_{j=1}^{\infty}\left(f\left(t_{j}\right)-f\left(t_{j}-\right)\right)\left(g\left(t_{j}\right)-g\left(t_{j}-\right)\right)\right| \\
& \leqslant\left|\sum_{i=1}^{n_{v}}\left(f\left(x_{i}\right)-f\left(u_{i}\right)\right)\left(g\left(x_{i}\right)-g\left(u_{i}\right)\right)-\sum_{j=1}^{m}\left(f\left(t_{j}\right)-f\left(t_{j}-\right)\right)\left(g\left(t_{j}\right)-g\left(t_{j}-\right)\right)\right| \\
& \quad \quad+\left|\sum_{j=m+1}^{\infty}\left(f\left(t_{j}\right)-f\left(t_{j}-\right)\right)\left(g\left(t_{j}\right)-g\left(t_{j}-\right)\right)\right|
\end{aligned}
$$

$$
\begin{aligned}
& =\left|\sum_{i=1}^{n_{v}}\left(f\left(x_{i}\right)-f\left(x_{i}-\right)\right)\left(g\left(x_{i}-\right)-g\left(u_{i}\right)\right)\right|+\left|\sum_{i=1}^{n_{v}}\left(f\left(x_{i}-\right)-f\left(u_{i}\right)\right)\left(g\left(x_{i}\right)-g\left(x_{i}-\right)\right)\right| \\
& \quad+\left|\sum_{i=1}^{n_{v}}\left(f\left(x_{i}-\right)-f\left(u_{i}\right)\right)\left(g\left(x_{i}-\right)-g\left(u_{i}\right)\right)\right|+\frac{\varepsilon}{6} .
\end{aligned}
$$

By Lemma 6.2 we have

$$
\begin{aligned}
& \left|\sum_{i=1}^{n_{v}}\left(f\left(x_{i}-\right)-f\left(u_{i}\right)\right)\left(g\left(x_{i}-\right)-g\left(u_{i}\right)\right)\right| \leqslant \frac{\varepsilon}{18} \\
& \left|\sum_{i=1}^{n_{v}}\left(f\left(x_{i}\right)-f\left(x_{i}-\right)\right)\left(g\left(x_{i}-\right)-g\left(x_{i}\right)\right)\right| \leqslant \frac{\varepsilon}{18 V_{\varphi}(A)} V_{\varphi}(A)=\frac{\varepsilon}{18}
\end{aligned}
$$

and

$$
\left|\sum_{i=1}^{n_{v}}\left(f\left(x_{i}\right)-f\left(x_{i}-\right)\right)\left(g\left(x_{i}\right)-g\left(x_{i}-\right)\right)\right| \leqslant \frac{\varepsilon}{18 V_{\psi}(B)} V_{\psi}(B)=\frac{\varepsilon}{18} .
$$

Thus

$$
\left|S_{-}(f, g, D)-S_{-}(f, g)\right| \leqslant \frac{\varepsilon}{18}+\frac{\varepsilon}{18}+\frac{\varepsilon}{18}+\frac{\varepsilon}{6} \leqslant \frac{\varepsilon}{3} .
$$

Similarly,

$$
\left|S_{+}(f, g, D)-S_{+}(f, g)\right| \leqslant \frac{\varepsilon}{3}
$$

Hence

$$
\begin{aligned}
& \left|S(f, g, D)-\left(S_{+}(f, g)-S_{-}(f, g)\right)\right| \\
& \quad \leqslant\left|S_{-}(f, g, D)-S_{-}(f, g)\right|+\left|S_{+}(f, g, D)-S_{+}(f, g)\right| \leqslant \frac{\varepsilon}{3}+\frac{\varepsilon}{3}=\frac{2}{3} \varepsilon
\end{aligned}
$$

Lemma 6.4. Let $f \in \mathrm{BV}_{\varphi}[a, b]$ and $g \in \mathrm{BV}_{\psi}[a, b]$ with $\sum_{n=1}^{\infty} \varphi^{-1}(1 / n) \psi^{-1}(1 / n)<$ $\infty$. Then for any given $\varepsilon>0$ there exists a positive function $\delta$ such that for any $\delta$-fine division $D$ of $[a, b]$ we have

$$
\left|S(f, g, D)-\left(S_{+}(f, g)-S_{-}(f, g)\right)\right| \leqslant \varepsilon
$$

Proof. Let $\varepsilon>0$, choose $v$ such that $\sum_{n=2^{v-1}}^{\infty} \varphi^{-1}(A / n) \psi^{-1}(B / n) \leqslant \varepsilon / 312$. Let $E_{v}=\left\{x_{1}, x_{2}, \ldots, x_{n_{v}}\right\}$ be given as in Lemma 2.1. Applying Lemma 6.3 to $E=E_{v}$, we get a positive constant $\delta^{\prime}$. Let $\delta$ be a positive function defined on $[a, b]$ with $\delta(x)<\delta^{\prime}$ for all $x \in[a, b]$ such that if $D=\{(\xi,[u, v])\}$ is a $\delta$-fine division
of $[a, b]$, then $[u, v] \subset\left(\xi-\delta^{\prime}, \xi+\delta^{\prime}\right)$ when $\xi \in E_{v}$ and $[u, v] \subset\left(x_{k}, x_{k+1}\right)$ when $\xi \in\left(x_{k}, x_{k+1}\right), k=1,2, \ldots, n_{v}-1$. Now let $D=\{(\xi,[u, v])\}$ be a $\delta$-fine division of $[a, b]$. Let $D=D_{1} \cup D_{2}$, where $D_{1}=\left\{(\xi,[u, v]) \in D: \xi \in E_{v}\right\}, D_{2}=D \backslash D_{1}$. Hence, by Lemma 6.3,

$$
\begin{aligned}
& \left|S(f, g, D)-\left(S_{+}(f, g)-S_{-}(f, g)\right)\right| \\
& \quad \leqslant\left|S_{-}\left(f, g, D_{2}\right)\right|+\left|S_{+}\left(f, g, D_{2}\right)\right|+\left|S\left(f, g, D_{1}\right)-\left(S_{+}(f, g)-S_{-}(f, g)\right)\right| \\
& \quad \leqslant\left|S_{-}\left(f, g, D_{2}\right)\right|+\left|S_{+}\left(f, g, D_{2}\right)\right|+\frac{2}{3} \varepsilon .
\end{aligned}
$$

By Lemma 4.5, we have

$$
\begin{aligned}
\left|S_{-}\left(f, g, D_{2}\right)\right| & =\left|\left(D_{2}\right) \sum(f(\xi)-f(u))(g(\xi)-g(u))\right| \\
& =\left|\left(D_{2}\right) \sum f(\xi)(g(\xi)-g(u))-\left(D_{2}\right) \sum f(u)(g(\xi)-g(u))\right| \\
& \leqslant 52 \sum_{n=2^{v-1}}^{\infty} \varphi^{-1}\left(\frac{A}{n}\right) \psi^{-1}\left(\frac{B}{n}\right) \leqslant \frac{\varepsilon}{6}
\end{aligned}
$$

and

$$
\begin{aligned}
\left|S_{+}\left(f, g, D_{2}\right)\right| & =\left|\left(D_{2}\right) \sum(f(v)-f(\xi))(g(v)-g(\xi))\right| \\
& \leqslant 52 \sum_{n=2^{v-1}}^{\infty} \varphi^{-1}\left(\frac{A}{n}\right) \psi^{-1}\left(\frac{B}{n}\right) \leqslant \frac{\varepsilon}{6}
\end{aligned}
$$

Hence,

$$
\begin{aligned}
\left|S(f, g, D)-\left(S_{+}(f, g)-S_{-}(f, g)\right)\right| & \leqslant\left|S_{-}\left(f, g, D_{2}\right)\right|+\left|S_{+}\left(f, g, D_{2}\right)\right|+\frac{2}{3} \varepsilon \\
& \leqslant \frac{1}{6} \varepsilon+\frac{1}{6} \varepsilon+\frac{2}{3} \varepsilon=\varepsilon .
\end{aligned}
$$

We can verify that $S_{-}(f, g), S_{+}(f, g)$ exist and $S_{-}(f, g)=\sum_{i=1}^{\infty}\left(f\left(t_{i}+\right)-f\left(t_{i}\right)\right)$ $\left(g\left(t_{i}+\right)-g\left(t_{i}\right)\right), S_{+}(f, g)=\sum_{i=1}^{\infty}\left(f\left(t_{i}\right)-f\left(t_{i}-\right)\right)\left(g\left(t_{i}\right)-g\left(t_{i}-\right)\right)$.

Theorem 6.5. Let $f \in \mathrm{BV}_{\varphi}[a, b]$ and $g \in \mathrm{BV}_{\psi}[a, b]$ with $\sum_{m=1}^{\infty} \varphi^{-1}(1 / m) \psi^{-1}(1 / m)$ $<\infty$. Then

$$
\int_{a}^{b} f \mathrm{~d} g+\int_{a}^{b} g \mathrm{~d} f=f(b) g(b)-f(a) g(a)+S(f, g)
$$

where $S(f, g)=\sum_{i=1}^{\infty}\left(f\left(t_{i}+\right)-f\left(t_{i}\right)\right)\left(g\left(t_{i}+\right)-g\left(t_{i}\right)\right)-\sum_{i=1}^{\infty}\left(f\left(t_{i}\right)-f\left(t_{i}-\right)\right)\left(g\left(t_{i}\right)-g\left(t_{i}-\right)\right)$ and $\left\{t_{i}\right\}$ are all common points of discontinuity of $f$ and $g$.

Proof. Since $S(f, g)=S_{+}(f, g)-S_{-}(f, g)$, by Lemma 6.1, $S(f, g)$ exists. Let $\varepsilon>0$ be given and let $f, g:[a, b] \rightarrow \mathbb{R}$. Then there exists a positive function $\delta_{1}$ on $[a, b]$ such that for any $\delta_{1}$-fine partial division $D^{\prime}=\left\{\left(\left[u_{i}, v_{i}\right], \xi_{i}\right)\right\}$ of $[a, b]$,

$$
\left|S\left(f, g, D^{\prime}\right)-S(f, g)\right| \leqslant \frac{\varepsilon}{2}
$$

Since $f$ is integrable with respect to $g$, there exists a positive function $\delta_{2}$ on $[a, b]$ such for any $\delta_{2}$-fine division $D^{\prime \prime}=\left\{\left(\left[t_{i}, t_{i+1}\right], \xi_{i}\right)\right\}$ of $[a, b]$, we have

$$
\left|\left(D^{\prime \prime}\right) \sum f\left(\xi_{i}\right)\left(g\left(t_{i+1}\right)-g\left(t_{i}\right)\right)-\int_{a}^{b} f \mathrm{~d} g\right| \leqslant \frac{\varepsilon}{2}
$$

Choose $\delta(\xi)=\min \left\{\delta_{1}(\xi), \delta_{2}(\xi)\right\}$. Let $D=\left\{\left(\left[t_{i}, t_{i+1}\right], \xi_{i}\right)\right\}$ be a $\delta$-fine partial division of $[a, b]$. We can see that

$$
\begin{aligned}
\mid & \left((D) \sum g\left(\xi_{i}\right)\left(f\left(t_{i+1}\right)-f\left(t_{i}\right)\right)\right)-\left(f(b) g(b)-f(a) g(a)+S(f, g)-\int_{a}^{b} f \mathrm{~d} g\right) \mid \\
= & \mid(D) \sum\left(g\left(\xi_{i}\right)\left(f\left(t_{i+1}\right)-f\left(t_{i}\right)\right)-f\left(t_{i+1}\right) g\left(t_{i+1}\right)+f\left(t_{i}\right) g\left(t_{i}\right)\right. \\
& \left.\quad+\int_{t_{i}}^{t_{i+1}} f \mathrm{~d} g\right)-S(f, g) \mid \\
= & \mid(D) \sum-f\left(\xi_{i}\right)\left(g\left(t_{i+1}\right)-g\left(t_{i}\right)\right)+\left(f\left(\xi_{i}\right)-f\left(t_{i}\right)\right)\left(g\left(\xi_{i}\right)-g\left(t_{i}\right)\right) \\
& -\left(f\left(t_{i+1}\right)-f\left(\xi_{i}\right)\right)\left(g\left(t_{i+1}\right)-g\left(\xi_{i}\right)\right)+\int_{t_{i}}^{t_{i+1}} f \mathrm{~d} g-S(f, g) \mid \\
\leqslant & \left|(D) \sum f\left(\xi_{i}\right)\left(g\left(t_{i+1}\right)-g\left(t_{i}\right)\right)-\int_{t_{i}}^{t_{i+1}} f \mathrm{~d} g\right|+|S(f, g, D)-S(f, g)| \\
\leqslant & \frac{\varepsilon}{2}+\frac{\varepsilon}{2}=\varepsilon
\end{aligned}
$$

Thus, we can conclude that $g$ is integrable to $f(b) g(b)-f(a) g(a)+S(f, g)-\int_{a}^{b} f \mathrm{~d} g$ on $[a, b]$ with respect to $f$.

Hence, we have

$$
\int_{a}^{b} f \mathrm{~d} g+\int_{a}^{b} g \mathrm{~d} f=f(b) g(b)-f(a) g(a)+S(f, g)
$$

## 7. Convergence theorem

In this section we will use Young's idea, see [11], [12], to prove some convergence theorems for our setting.

Definition 7.1 (Two-norm convergence). A sequence $\left\{f^{(n)}\right\}$ of functions in $\mathrm{BV}_{\varphi}[a, b]$ is said to be two-norm convergent to $f$ if
(i) $f^{(n)}$ is uniformly convergent to $f$ on $[a, b]$, and
(ii) $V_{\varphi}\left(f^{(n)}\right) \leqslant A$ for every $n=1,2, \ldots$..

In symbols, we denote the two-norm convergence by $f^{(n)} \rightarrow f$.
It is clear that $\mathrm{BV}_{\varphi}[a, b]$ is complete under two-norm convergence, i.e., if $f^{(n)} \in$ $\mathrm{BV}_{\varphi}[a, b], n=1,2, \ldots$, and $f^{(n)} \rightarrow f$, then $f \in \mathrm{BV}_{\varphi}[a, b]$.

We need the following two lemmas.

Lemma 7.2. Let $\vartheta$ be a strictly decreasing continuous function on $(0, \infty)$ with $\lim _{x \rightarrow \infty} \vartheta(x)=0$ and let $\int_{1}^{\infty} \vartheta(x) \mathrm{d} x$ exist. Then there exists a strictly increasing continuous function $\varrho$ on $[0, \infty)$ with $\lim _{x \rightarrow \infty} \varrho(x)=\infty$ such that

$$
\lim _{x \rightarrow \infty} \frac{\varrho(x)}{x}=\infty \quad \text { and } \quad \int_{1}^{\infty} \vartheta(x) \mathrm{d} \varrho(x) \text { exists. }
$$

Proof. Since $\int_{1}^{\infty} \vartheta(x) \mathrm{d} x$ exists, there exists a positive function on $[0, \infty)$ $\iota(x) \geqslant 0$ with $\lim _{x \rightarrow \infty} \iota(x)=\infty$ and $\iota(x)=0$ for $x \leqslant 1$, such that $\int_{1}^{\infty} \vartheta(x) \iota(x) \mathrm{d} x$ and $\int_{0}^{x} \iota(t) \mathrm{d} t$ exist for every $x \in(0, \infty)$. Let

$$
\varrho(x)=x+\int_{0}^{x} \iota(t) \mathrm{d} t .
$$

Then $\varrho$ is a strictly increasing function with $\lim _{x \rightarrow \infty} \varrho(x)=\infty$. Therefore,

$$
\int_{1}^{\infty} \vartheta(x) \mathrm{d} \varrho(x)=\int_{1}^{\infty} \vartheta(x)[1+\iota(x)] \mathrm{d} x<\infty
$$

Now we shall prove that $\lim _{x \rightarrow \infty} \varrho(x) / x=\infty$. Let $x>2 n$. Then $(x-n) / x>\frac{1}{2}$. By Mean-Value Theorem for integral, there exists $y \in(n, x)$ such that

$$
\frac{1}{x-n} \int_{n}^{x} \iota(x) \mathrm{d} x=\iota(y) .
$$

Hence

$$
\frac{\varrho(x)}{x}=1+\frac{1}{x} \int_{0}^{x} \iota(x) \mathrm{d} x \geqslant \frac{x-n}{x}\left[\frac{1}{x-n} \int_{n}^{x} \iota(x) \mathrm{d} x\right] \geqslant \frac{1}{2} \iota(y) \geqslant \frac{1}{2} \iota(n) .
$$

Since $\iota(n) \rightarrow \infty$ as $n \rightarrow \infty$, we have

$$
\lim _{x \rightarrow \infty} \frac{\varrho(x)}{x}=\infty
$$

Corollary 7.3. Let $\vartheta$ be a strictly decreasing continuous function on $(0, \infty)$ with $\lim _{x \rightarrow \infty} \vartheta(x)=0$ and let $\int_{1}^{\infty} \vartheta(x) \mathrm{d} x$ exist. Then there exists a strictly increasing continuous function $\varsigma$ on $(0, \infty)$ with $\lim _{x \rightarrow \infty} \varsigma(x)=\infty$, such that

$$
\lim _{x \rightarrow \infty} \frac{\varsigma(x)}{x}=0 \quad \text { and } \quad \int_{1}^{\infty} \vartheta(\varsigma(x)) \mathrm{d} x \quad \text { exists. }
$$

Proof. Let $\varsigma=\varrho^{-1}$, where $\varrho$ is given in Lemma 7.2. Thus we get the required result.

Lemma 7.4. Suppose $\sum_{n=1}^{\infty} \varphi^{-1}(1 / n) \psi^{-1}(1 / n)<\infty$. Then there exist two $N$ functions $\varphi^{*}, \psi^{*}$ such that $\varphi^{*}(u) \leqslant \bar{\pi}(u) \varphi(u)$ and $\psi^{*}(u) \leqslant \bar{\gamma}(u) \psi(u)$, where $\bar{\pi}, \bar{\gamma}$ are increasing and $\lim _{x \rightarrow 0} \bar{\pi}(x)=\lim _{x \rightarrow 0} \bar{\gamma}(x)=0$, with

$$
\sum_{n=1}^{\infty}\left(\varphi^{*}\right)^{-1}\left(\frac{1}{n}\right)\left(\psi^{*}\right)^{-1}\left(\frac{1}{n}\right)<\infty
$$

Proof. Given $\varphi, \psi$ and $\sum_{n=1}^{\infty} \varphi^{-1}(1 / n) \psi^{-1}(1 / n)<\infty$, we want to construct $\varphi^{*}, \psi^{*}$ such that $\varphi^{*}(u) \leqslant \bar{\pi}(u) \varphi(u), \psi^{*}(u) \leqslant \bar{\gamma}(u) \psi(u)$, where $\bar{\pi}, \bar{\gamma}$ are increasing functions with $\lim _{x \rightarrow 0} \bar{\pi}(x)=\lim _{x \rightarrow 0} \bar{\gamma}(x)=0$ and

$$
\sum_{n=1}^{\infty}\left(\varphi^{*}\right)^{-1}\left(\frac{1}{n}\right)\left(\psi^{*}\right)^{-1}\left(\frac{1}{n}\right)<\infty
$$

Let $\vartheta(u)=\varphi^{-1}(1 / u) \psi^{-1}(1 / u)$ for $u \in(0, \infty)$. Then $\vartheta$ satisfies the conditions of Corollary 7.3. Hence there exists a strictly increasing continuous function $\varsigma$ on $[0, \infty)$ with $\lim _{x \rightarrow \infty} \varsigma(x)=\infty$, such that

$$
\lim _{x \rightarrow \infty} \frac{\varsigma(x)}{x}=0 \quad \text { and } \quad \int_{1}^{\infty} \vartheta(\varsigma(x)) \mathrm{d} x \quad \text { exists. }
$$

Let $\theta(u)=u \varsigma\left(u^{-1}\right)$ for $u \in(0, \infty)$ and $\theta(0)=0$. Then $\lim _{u \rightarrow 0} \theta(u)=\lim _{u \rightarrow 0} \varsigma\left(u^{-1}\right) / u^{-1}=$ 0 and $u / \theta(u)=1 / \varsigma\left(u^{-1}\right)$ is a strictly increasing continuous function on $(0, \infty)$.

Let $\Phi(u)=\varphi^{-1}(u / \theta(u)), \Psi(u)=\psi^{-1}(u / \theta(u)), \Phi(0)=0$ and $\Psi(0)=0$. Then $\Phi$ and $\Psi$ are strictly increasing continuous functions on $[0, \infty)$. Furthermore, let $\varphi^{*}=(\Phi)^{-1}$ and $\psi^{*}=(\Psi)^{-1}$. Then

$$
\begin{aligned}
\sum_{n=1}^{\infty}\left(\varphi^{*}\right)^{-1}\left(\frac{1}{n}\right)\left(\psi^{*}\right)^{-1}\left(\frac{1}{n}\right) & =\sum_{n=1}^{\infty} \varphi^{-1}\left(\frac{n^{-1}}{\theta\left(n^{-1}\right)}\right) \psi^{-1}\left(\frac{n^{-1}}{\theta\left(n^{-1}\right)}\right) \\
& =\sum_{n=1}^{\infty} \varphi^{-1}\left(\frac{1}{\varsigma(n)}\right) \psi^{-1}\left(\frac{1}{\varsigma(n)}\right) \\
& =\sum_{n=1}^{\infty} \vartheta(\varsigma(n)) \leqslant \int_{1}^{\infty} \vartheta(\varsigma(x)) \mathrm{d} x<\infty
\end{aligned}
$$

since $\vartheta(\varsigma(x))$ is non-negative.
If $t=\left(\varphi^{*}\right)^{-1}\left(u^{*}\right)=\varphi^{-1}\left(u^{*} / \theta\left(u^{*}\right)\right)$, then $\varphi^{*}(t)=u^{*}$. On the other hand, if $t=\varphi^{-1}(u)$, then $\varphi(t)=u$. Hence $u=u^{*} / \theta\left(u^{*}\right)$ and

$$
\frac{\varphi^{*}(t)}{\varphi(t)}=\frac{u^{*}}{u}=\theta\left(u^{*}\right)=\theta\left(\varphi^{*}(t)\right)=: \pi(t)
$$

clearly $\lim _{t \rightarrow 0} \pi(t)=\lim _{t \rightarrow 0} \theta\left(\varphi^{*}(t)\right)=0$. Similarly, we have

$$
\frac{\psi^{*}(t)}{\psi(t)}=\frac{u^{*}}{u}=\theta\left(u^{*}\right)=\theta\left(\psi^{*}(t)\right)=: \gamma(t)
$$

and $\lim _{t \rightarrow 0} \pi(t)=\lim _{t \rightarrow 0} \theta\left(\varphi^{*}(t)\right)=0$. Denoting by $\bar{\pi}(t), \bar{\gamma}(t)$ the upper bounds of $\pi(u), \gamma(u)$ for $0<u \leqslant t$ we see that $\bar{\pi}, \bar{\gamma}$ are increasing functions. Then

$$
\varphi^{*}(t) \leqslant \bar{\pi}(t) \varphi(t)
$$

and

$$
\psi^{*}(t) \leqslant \bar{\gamma}(t) \psi(t)
$$

Let $D=\{[u, v]\}$ be a partition of an interval $[\alpha, \beta]$. By Lemma 7.4, we have

$$
\begin{aligned}
(D) \sum \varphi^{*}(|f(v)-f(u)|) & =(D) \sum \bar{\pi}(|f(v)-f(u)|) \varphi(|f(v)-f(u)|) \\
& \leqslant \bar{\pi}\left(2\|f\|_{\infty}\right)(D) \sum \varphi(|f(v)-f(u)|)
\end{aligned}
$$

Hence, if $A$ and $A^{*}$ are the $\varphi$-variation and $\varphi^{*}$-variation of $f$, respectively, on $[\alpha, \beta]$, we have

$$
A^{*} \leqslant A \bar{\pi}\left(2\|f\|_{\infty}\right) \leqslant A \bar{\pi}\left(\varphi^{-1}(A)\right)
$$

Theorem 7.5. If $g \in \mathrm{BV}_{\psi}[a, b]$ and $\left\{f^{(n)}\right\}$ is two-norm convergent to $f$ in $\mathrm{BV}_{\varphi}[a, b]$ with $\sum_{m=1}^{\infty} \varphi^{-1}(1 / m) \psi^{-1}(1 / m)<\infty$, then $\int_{a}^{b} f \mathrm{~d} g$ exists and

$$
\lim _{n \rightarrow \infty} \int_{a}^{b} f^{(n)} \mathrm{d} g=\int_{a}^{b} f \mathrm{~d} g
$$

Proof. Let $\varepsilon>0$ be given. Let $\left\{f^{(n)}\right\}$ be two-norm convergent to $f$ in $\mathrm{BV}_{\varphi}[a, b]$ and $g \in \mathrm{BV}_{\psi}[a, b]$. By the convexity of $\mathrm{BV}_{\varphi}[a, b], \frac{1}{2}\left(f^{(n)}-f\right) \in \mathrm{BV}_{\varphi}[a, b]$. Hence, $\int_{a}^{b}\left(f^{(n)}-f\right) \mathrm{d} g$ exists. Thus, there is a positive function $\delta_{n}$ such that for every $\delta_{n}$-fine division $D=\left\{\left(\left[t_{i}, t_{i+1}\right], \xi_{i}\right)\right\}$ of $[a, b]$,

$$
\left|\left(\int_{a}^{b}\left(f^{(n)}-f\right) \mathrm{d} g\right)-(D) \sum\left(f^{(n)}\left(\xi_{i}\right)-f\left(\xi_{i}\right)\right)\left(g\left(t_{i+1}\right)-g\left(t_{i}\right)\right)\right| \leqslant \varepsilon
$$

Let

$$
V_{\varphi}\left(\frac{1}{2}\left(f^{(n)}-f\right)\right) \leqslant V_{\varphi}\left(f^{(n)}\right)+V_{\varphi}(f) \leqslant A \text { for every } n \text { and } V_{\psi}(g)=B
$$

By Lemma 7.4, there exist two $N$-function $\varphi^{*}$ and $\psi^{*}$ such that $\varphi^{*}(u) \leqslant \bar{\pi}(u) \varphi(u)$ and $\psi^{*}(u) \leqslant \bar{\gamma}(u) \psi(u)$, where $\bar{\pi}, \bar{\gamma}$ are increasing and $\lim _{x \rightarrow 0} \bar{\pi}(x)=\lim _{x \rightarrow 0} \bar{\gamma}(x)=0$, with

$$
\sum_{n=1}^{\infty}\left(\varphi^{*}\right)^{-1}\left(\frac{1}{n}\right)\left(\psi^{*}\right)^{-1}\left(\frac{1}{n}\right)<\infty
$$

By Lemma 2.3, there exists a positive integer $v$ such that

$$
\sum_{n=v+1}^{\infty}\left(\varphi^{*}\right)^{-1}\left(\frac{A \bar{\pi}\left(\varphi^{-1}(A)\right)}{n}\right)\left(\psi^{*}\right)^{-1}\left(\frac{B \bar{\gamma}\left(\psi^{-1}(B)\right)}{n}\right)<\varepsilon
$$

For this $v$, choose $\tau>0$ such that

$$
\left(\varphi^{*}\right)^{-1}(A \bar{\pi}(\tau)) \leqslant \frac{\varepsilon}{v\left(\psi^{*}\right)^{-1}\left(\frac{B \bar{\pi}\left(\psi^{-1}(B)\right)}{v}\right)}
$$

Hence for $n=1,2, \ldots, v$,

$$
\left(\varphi^{*}\right)^{-1}\left(\frac{A \bar{\pi}(\tau)}{n}\right) \leqslant \frac{\varepsilon}{v\left(\psi^{*}\right)^{-1}\left(\frac{B \bar{\pi}\left(\psi^{-1}(B)\right)}{n}\right)} .
$$

Since $f^{(n)}$ converge to $f$ uniformly on $[a, b]$, there is a positive integer $N$ such that for every $n \geqslant N$, we have

$$
\sup _{t \in[a, b]} \frac{1}{2}\left(\left|f^{(n)}(t)-f(t)\right|\right)=\left\|\frac{1}{2}\left(f^{(n)}-f\right)\right\|_{\infty}<\min \left\{\varepsilon, \frac{1}{2} \tau\right\} .
$$

We may assume that when $n \geqslant N$, then $\mid\left(f^{(n)}-f\right)(a)(g(a+)-g(a))+\left(f^{(n)}-\right.$ $f)(a+)(g(b-)-g(a+))+\left(f^{(n)}-f\right)(b)(g(b)-g(b-)) \mid \leqslant \varepsilon$.

Hence for $n \geqslant N$, applying Corollary 5.2 to $\frac{1}{2}\left(f^{(n)}-f\right)$, we get

$$
\begin{aligned}
\mid \int_{a}^{b} f^{(n)} \mathrm{d} g- & \left.\int_{a}^{b} f \mathrm{~d} g|=2| \int_{a}^{b} \frac{f^{(n)}-f}{2} \mathrm{~d} g \right\rvert\, \\
\leqslant & 2 \cdot 6 \sum_{n=1}^{\infty}\left(\varphi^{*}\right)^{-1}\left(\frac{V_{\varphi^{*}}\left(\frac{1}{2}\left(f^{(n)}-f\right)\right)}{n}\right)\left(\psi^{*}\right)^{-1}\left(\frac{V_{\psi^{*}}(g)}{n}\right)+\varepsilon \\
\leqslant & 12 \sum_{n=1}^{v}\left(\varphi^{*}\right)^{-1}\left(\frac{V_{\varphi^{*}}\left(\frac{1}{2}\left(f^{(n)}-f\right)\right)}{n}\right)\left(\psi^{*}\right)^{-1}\left(\frac{V_{\psi^{*}(g)}}{n}\right) \\
& +12 \sum_{n=v+1}^{\infty}\left(\varphi^{*}\right)^{-1}\left(\frac{V_{\varphi^{*}}\left(\frac{1}{2}\left(f^{(n)}-f\right)\right)}{n}\right)\left(\psi^{*}\right)^{-1}\left(\frac{V_{\psi^{*}}(g)}{n}\right)+\varepsilon \\
\leqslant & 12 \sum_{n=1}^{v}\left(\varphi^{*}\right)^{-1}\left(\frac{A \bar{\pi}\left(2\left\|\frac{1}{2}\left(f^{(n)}-f\right)\right\|_{\infty}\right)}{n}\right)\left(\psi^{*}\right)^{-1}\left(\frac{B \bar{\gamma}\left(\psi^{-1}(B)\right)}{n}\right) \\
& +12 \sum_{n=v+1}^{\infty}\left(\varphi^{*}\right)^{-1}\left(\frac{A \bar{\pi}\left(\varphi^{-1}(A)\right)}{n}\right)\left(\psi^{*}\right)^{-1}\left(\frac{B \bar{\gamma}\left(\psi^{-1}(B)\right)}{n}\right)+\varepsilon \\
\leqslant & 12 \sum_{n=1}^{v}\left(\varphi^{*}\right)^{-1}\left(\frac{A \bar{\pi}\left(2\left\|\frac{1}{2}\left(f^{(n)}-f\right)\right\|_{\infty}\right)}{n}\right)\left(\psi^{*}\right)^{-1}\left(\frac{B \bar{\gamma}\left(\psi^{-1}(B)\right)}{n}\right)+13 \varepsilon \\
\leqslant & 12 \sum_{n=1}^{v}\left(\varphi^{*}\right)^{-1}\left(\frac{A \bar{\pi}(\tau)}{n}\right)\left(\psi^{*}\right)^{-1}\left(\frac{B \bar{\gamma}\left(\psi^{-1}(B)\right)}{n}\right)+13 \varepsilon \\
\leqslant & 12 \varepsilon+13 \varepsilon=25 \varepsilon .
\end{aligned}
$$

Hence, $\lim _{n \rightarrow \infty} \int_{a}^{b} f^{(n)} \mathrm{d} g=\int_{a}^{b} f \mathrm{~d} g$.

Theorem 7.6. If $f \in \mathrm{BV}_{\varphi}[a, b]$ and $\left\{g^{(n)}\right\}$ is two-norm convergent to $g$ in $\mathrm{BV}_{\varphi}[a, b]$ with $\sum_{m=1}^{\infty} \varphi^{-1}(1 / m) \psi^{-1}(1 / m)<\infty$, then $\int_{a}^{b} f \mathrm{~d} g$ exists and

$$
\lim _{n \rightarrow \infty} \int_{a}^{b} f \mathrm{~d} g^{(n)}=\int_{a}^{b} f \mathrm{~d} g
$$

Proof. Since $g^{(n)}$ converge to $g$ uniformly, there exists a positive integer $N$ such that for every $n>N_{1}$ we have

$$
\begin{aligned}
& \left|S\left(f, g^{(n)}\right)-S(f, g)\right| \leqslant \frac{1}{4} \varepsilon \\
& \left|\left(f^{(n)}(b)-f(b)\right) g(b)\right| \leqslant \frac{1}{4} \varepsilon
\end{aligned}
$$

and

$$
\left|\left(f^{(n)}(a)-f(a)\right) g(a)\right| \leqslant \frac{1}{4} \varepsilon .
$$

By Theorem 7.5 there exists a positive integer $N>N_{1}$ such that for any $n>N$ we have

$$
\left|\int_{a}^{b} g^{(n)} \mathrm{d} f-\int_{a}^{b} g \mathrm{~d} f\right| \leqslant \frac{\varepsilon}{4}
$$

Hence

$$
\begin{aligned}
\left|\int_{a}^{b} f \mathrm{~d} g^{(n)}-\int_{a}^{b} f \mathrm{~d} g\right| \leqslant & \left|\int_{a}^{b} g^{(n)} \mathrm{d} f-\int_{a}^{b} g \mathrm{~d} f\right|+\left|\left(f^{(n)}(b)-f(b)\right) g(b)\right| \\
& +\left|\left(f^{(n)}(a)-f(a)\right) g(a)\right|+\left|S\left(f, g^{(n)}\right)-S(f, g)\right| \leqslant \varepsilon
\end{aligned}
$$

Hence, $\lim _{n \rightarrow \infty} \int_{a}^{b} f \mathrm{~d} g^{(n)}=\int_{a}^{b} f \mathrm{~d} g$.
Hence, we also have the following theorem.
Theorem 7.7. If $\left\{f^{(n)}\right\}$ and $\left\{g^{(n)}\right\}$ are two-norm convergent to $f$ and $g$ in $\mathrm{BV}_{\varphi}[a, b]$ and $\mathrm{BV}_{\psi}[a, b]$, respectively, with $\sum_{m=1}^{\infty} \varphi^{-1}(1 / m) \psi^{-1}(1 / m)<\infty$, then $\int_{a}^{b} f \mathrm{~d} g$ exists and

$$
\lim _{n \rightarrow \infty} \int_{a}^{b} f^{(n)} \mathrm{d} g^{(n)}=\int_{a}^{b} f \mathrm{~d} g
$$
