# A PRIORI ESTIMATES AND SOLVABILITY OF A NON-RESONANT GENERALIZED MULTI-POINT BOUNDARY VALUE PROBLEM OF MIXED DIRICHLET-NEUMANN-DIRICHLET TYPE INVOLVING A $p$-LAPLACIAN TYPE OPERATOR 

Chaitan P. Gupta, Reno

(Received February 23, 2006, in revised version August 14, 2006)

Abstract. This paper is devoted to the problem of existence of a solution for a nonresonant, non-linear generalized multi-point boundary value problem on the interval $[0,1]$. The existence of a solution is obtained using topological degree and some a priori estimates for functions satisfying the boundary conditions specified in the problem.

Keywords: generalized multi-point boundary value problems, p-Laplace type operator, non-resonance, a priori estimates, topological degree

MSC 2000: 34B10, 34B15, 34L30

## 1. Introduction

Let $\varphi$ be an odd increasing homeomorphism from $\mathbb{R}$ onto $\mathbb{R}, f:[0,1] \times \mathbb{R} \times \mathbb{R} \rightarrow \mathbb{R}$ a function satisfying Carathéodory conditions and $e:[0,1] \rightarrow \mathbb{R}$ be a function in $L^{1}[0,1]$. Let $\xi_{i}, \tau_{j} \in(0,1), a_{i}, b_{j} \in \mathbb{R}, i=1,2, \ldots, m-2, j=1,2, \ldots, n-2$, $0<\xi_{1}<\xi_{2}<\ldots<\xi_{m-2}<1,0<\tau_{1}<\tau_{2}<\ldots<\tau_{n-2}<1$ be given. We study the problem of existence of solutions for the generalized multi-point boundary value problem

$$
\begin{gather*}
\left(\varphi\left(x^{\prime}\right)\right)^{\prime}=f\left(t, x, x^{\prime}\right)+e(t), \quad \text { a.e. on }[0,1],  \tag{1}\\
x(0)=\sum_{i=1}^{m-2} a_{i} x^{\prime}\left(\xi_{i}\right), \quad x(1)=\sum_{j=1}^{n-2} b_{j} x\left(\tau_{j}\right)
\end{gather*}
$$

in the non-resonance case. We say that this problem is non-resonant if the associated problem

$$
\begin{gather*}
\left(\varphi\left(x^{\prime}\right)\right)^{\prime}=0, \quad \text { a.e. on }[0,1],  \tag{2}\\
x(0)=\sum_{i=1}^{m-2} a_{i} x^{\prime}\left(\xi_{i}\right), \quad x(1)=\sum_{j=1}^{n-2} b_{j} x\left(\tau_{j}\right)
\end{gather*}
$$

has the trivial solution as its only solution. This is the case if the "non-resonance condition"

$$
\begin{equation*}
\left(\sum_{i=1}^{m-2} a_{i}\right)\left(1-\sum_{j=1}^{n-2} b_{j}\right) \neq \sum_{j=1}^{n-2} b_{j} \tau_{j}-1 \tag{3}
\end{equation*}
$$

holds. This problem was studied by Gupta, Ntouyas, and Tsamatos in [20] when the homeomorphism $\varphi$ from $\mathbb{R}$ onto $\mathbb{R}$ is the identity homeomorphism, i.e., for second order ordinary differential equations when $a_{i}, b_{j} \in \mathbb{R}$ have the same sign for all $i=1,2, \ldots, m-2, j=1,2, \ldots, n-2$. The study of multi-point boundary value problems for nonlinear second order ordinary differential equations was initiated by Il'in and Moiseev in [23], [24] who were motivated by the works of Bitsadze and Samarskiĭ on nonlocal linear elliptic boundary value problems, [2], [3], [4], and it has been the subject of many papers, see for example [5], [6], [11], [12], [13], [14], [15], [16], [17], [18], [19], [20], [22], [25], [30] and [31]. More recently multipoint boundary value problems involving a $p$-Laplacian type operator or the more general operator $-\left(\varphi\left(x^{\prime}\right)\right)^{\prime}$ have been studied in [1], [7], [8], [9], [10], [26], to mention just a few.

We present in Section 2 some a priori estimates for functions $x$ that satisfy the boundary conditions in (1). Our a priori estimates utilize the non-resonance condition for the boundary value problem (1). In Section 3 we present an existence theorem for the boundary value problem (1) using the degree theory.

## 2. A PRIORI EStimates

We shall assume the following throughout the rest of the paper:
(a) For any constant $K>0$,

$$
\begin{equation*}
\alpha(K):=\lim \sup _{z \rightarrow \infty} \frac{\varphi(K z)}{\varphi(z)}<\infty \tag{4}
\end{equation*}
$$

(b) For any $\sigma, 0 \leqslant \sigma<1$,

$$
\begin{equation*}
\tilde{\alpha}(\sigma):=\lim \sup _{z \rightarrow \infty} \frac{\varphi(\sigma z)}{\varphi(z)}<1 \tag{5}
\end{equation*}
$$

(c) $\xi_{i}, \tau_{j} \in(0,1), a_{i}, b_{j} \in \mathbb{R}, i=1,2, \ldots, m-2, j=1,2, \ldots, n-2,0<\xi_{1}<$ $\xi_{2}<\ldots<\xi_{m-2}<1,0<\tau_{1}<\tau_{2}<\ldots<\tau_{n-2}<1$ are such that the non-resonance condition (3) holds.
We observe that when the non-resonance condition (3) holds then at least one of $1-\sum_{j=1}^{n-2} b_{j}, \sum_{j=1}^{n-2} b_{j} \tau_{j}-1$ is non-zero. For $a \in \mathbb{R}$, let us denote $a^{+}=\max (a, 0)$, $a^{-}=\max (-a, 0)$ so that $a=a^{+}-a^{-}$and $|a|=a^{+}+a^{-}$. Furthermore, let us define (6)

$$
\sigma_{1} \equiv \begin{cases}\min \left\{\frac{\sum_{j=1}^{n-2} b_{j}^{+}}{1+\sum_{j=1}^{n-2} b_{j}^{-}}, \frac{1+\sum_{j=1}^{n-2} b_{j}^{-}}{\sum_{j=1}^{n-2} b_{j}^{+}}\right\} \in[0,1), & \text { if } 1-\sum_{j=1}^{n-2} b_{j} \neq 0 \text { and } \sum_{j=1}^{n-2} b_{j}^{+} \neq 0 \\ 0, & \text { if } 1-\sum_{j=1}^{n-2} b_{j} \neq 0 \text { and } \sum_{j=1}^{n-2} b_{j}^{+}=0 \\ 1, & \text { if } 1-\sum_{j=1}^{n-2} b_{j}=0\end{cases}
$$

Notice that $\sigma_{1} \in[0,1]$.
Theorem 1. Let assumption (c) hold. Also let a function $x$ be such that $x, x^{\prime}$ are absolutely continuous on $[0,1]$ and $x(0)=\sum_{i=1}^{m-2} a_{i} x^{\prime}\left(\xi_{i}\right), x(1)=\sum_{j=1}^{n-2} b_{j} x\left(\tau_{j}\right)$. Then there exists an $M \in(0, \infty)$ such that

$$
\begin{equation*}
\|x\|_{\infty} \leqslant M\left\|x^{\prime}\right\|_{\infty} \tag{7}
\end{equation*}
$$

Proof. We see from $x(t)=x(0)+\int_{0}^{t} x^{\prime}(s) \mathrm{d} s$ and the assumption that $x(0)=$ $\sum_{i=1}^{m-2} a_{i} x^{\prime}\left(\xi_{i}\right)$ that

$$
\begin{equation*}
|x(t)| \leqslant\left(\sum_{i=1}^{m-2}\left|a_{i}\right|+1\right)\left\|x^{\prime}\right\|_{\infty} \quad \text { for } t \in[0,1] \tag{8}
\end{equation*}
$$

Accordingly we get

$$
\begin{equation*}
\|x\|_{\infty} \leqslant\left(\sum_{i=1}^{m-2}\left|a_{i}\right|+1\right)\left\|x^{\prime}\right\|_{\infty} \tag{9}
\end{equation*}
$$

Now, when $1-\sum_{j=1}^{n-2} b_{j}=0$, estimate (7) holds with $M=1+\sum_{i=1}^{m-2}\left|a_{i}\right|$. Next, let us assume in the following that $1-\sum_{j=1}^{n-2} b_{j} \neq 0$.

Now, we see from $x(1)-x\left(\tau_{j}\right)=\int_{\tau_{j}}^{1} x^{\prime}(s) \mathrm{d} s$, for $j=1,2, \ldots, n-2$ and from the assumption $x(1)=\sum_{j=1}^{n-2} b_{j} x\left(\tau_{j}\right)$ that $\left(\sum_{j=1}^{n-2} b_{j}-1\right) x(1)=\sum_{j=1}^{n-2} b_{j} \int_{\tau_{j}}^{1} x^{\prime}(s) \mathrm{d} s$. It follows that

$$
\begin{equation*}
|x(1)| \leqslant \frac{\sum_{j=1}^{n-2}\left|b_{j}\left(1-\tau_{j}\right)\right|}{\left|1-\sum_{j=1}^{n-2} b_{j}\right|}\left\|x^{\prime}\right\|_{\infty} \tag{10}
\end{equation*}
$$

Next, we use the equations $x(t)-x\left(\tau_{j}\right)=\int_{\tau_{j}}^{t} x^{\prime}(s) \mathrm{d} s$ for $t \in[0,1], j=1,2, \ldots, n-2$, and the assumption $x(1)=\sum_{j=1}^{n-2} b_{j} x\left(\tau_{j}\right)$ to get

$$
\begin{equation*}
x(t)=\frac{1}{\sum_{j=1}^{n-2} b_{j}}\left(x(1)+\sum_{j=1}^{n-2} b_{j} \int_{\tau_{j}}^{t} x^{\prime}(s) \mathrm{d} s\right) \quad \text { for } t \in[0,1] . \tag{11}
\end{equation*}
$$

It follows from (10), (11) and with $\mu_{j}=\max \left(\tau_{j}, 1-\tau_{j}\right)$ for $j=1,2, \ldots, n-2$ that

$$
\begin{equation*}
\|x\|_{\infty} \leqslant \frac{1}{\left|\sum_{j=1}^{n-2} b_{j}\right|}\left(\frac{\sum_{j=1}^{n-2}\left|b_{j}\left(1-\tau_{j}\right)\right|}{\left|1-\sum_{j=1}^{n-2} b_{j}\right|}+\sum_{j=1}^{n-2} \mu_{j}\left|b_{j}\right|\right)\left\|x^{\prime}\right\|_{\infty} \tag{12}
\end{equation*}
$$

Similarly, starting from the equation $x(t)=x(1)-\int_{t}^{1} x^{\prime}(s) \mathrm{d} s$, we obtain the estimate

$$
\begin{equation*}
\|x\|_{\infty} \leqslant\left(\frac{\sum_{j=1}^{n-2}\left|b_{j}\left(1-\tau_{j}\right)\right|}{\left|1-\sum_{j=1}^{n-2} b_{j}\right|}+1\right)\left\|x^{\prime}\right\|_{\infty} \tag{13}
\end{equation*}
$$

Next, since $x(1)=\sum_{j=1}^{n-2} b_{j} x\left(\tau_{j}\right)$, we see that

$$
x(1)+\sum_{j=1}^{n-2} b_{j}^{-} x\left(\tau_{j}\right)=\sum_{j=1}^{n-2} b_{j}^{+} x\left(\tau_{j}\right) .
$$

It follows, by the intermediate value theorem, that there must exist $\chi_{1}, \chi_{2}$ in $[0,1]$ such that

$$
\begin{equation*}
\left(1+\sum_{j=1}^{n-2} b_{j}^{-}\right) x\left(\chi_{1}\right)=\left(\sum_{i=1}^{m-2} b_{j}^{+}\right) x\left(\chi_{2}\right) . \tag{14}
\end{equation*}
$$

If now one of $x\left(\chi_{1}\right), x\left(\chi_{2}\right)$ is zero, we see using one of the two equations

$$
\begin{equation*}
x(t)=x\left(\chi_{k}\right)+\int_{\chi_{k}}^{t} x^{\prime}(s) \mathrm{d} s, \quad k=1,2, \quad t \in[0,1] \tag{15}
\end{equation*}
$$

that

$$
\begin{equation*}
\|x\|_{\infty} \leqslant\left\|x^{\prime}\right\|_{\infty} \tag{16}
\end{equation*}
$$

If both $x\left(\chi_{1}\right), x\left(\chi_{2}\right)$ are non-zero it is easy to see from (14) that $x\left(\chi_{1}\right) \neq x\left(\chi_{2}\right)$, since we have assumed that $1-\sum_{j=1}^{n-2} b_{j} \neq 0$, so that $1+\sum_{j=1}^{n-2} b_{j}^{-} \neq \sum_{j=1}^{n-2} b_{j}^{+}$. It then follows easily from (14) and (15) that

$$
\begin{equation*}
\|x\|_{\infty} \leqslant \frac{1}{1-\sigma_{1}}\left\|x^{\prime}\right\|_{\infty} \tag{17}
\end{equation*}
$$

where $\sigma_{1}$ is defined in (6).
Estimate (7) is now immediate from (9), (12), (13), (16), (17) with

$$
\begin{aligned}
M= & \min \left\{\frac{1}{\left|\sum_{j=1}^{n-2} b_{j}\right|}\left(\sum_{j=1}^{n-2}\left|b_{j}\right| \mu_{j}+\frac{\sum_{j=1}^{n-2}\left|b_{j}\left(1-\tau_{j}\right)\right|}{\left|1-\sum_{j=1}^{n-2} b_{j}\right|}\right)\right. \\
& \left.1+\frac{\sum_{j=1}^{n-2}\left|b_{j}\left(1-\tau_{j}\right)\right|}{\left|1-\sum_{j=1}^{n-2} b_{j}\right|}, \frac{1}{1-\sigma_{1}}, 1+\sum_{i=1}^{m-2}\left|a_{i}\right|\right\}
\end{aligned}
$$

when $1-\sum_{j=1}^{n-2} b_{j} \neq 0$. This completes the proof of the theorem.
Lemma 2. Let us set

$$
\begin{equation*}
A=\left(1-\sum_{j=1}^{n-2} b_{j}\right)^{+}+\sum_{j=1}^{n-2}\left[b_{j}\left(1-\tau_{j}\right)\right]^{+}+\sum_{i=1}^{m-2}\left[a_{i}\left(1-\sum_{j=1}^{n-2} b_{j}\right)\right]^{+} \tag{18}
\end{equation*}
$$

and

$$
\begin{equation*}
B=\left(1-\sum_{j=1}^{n-2} b_{j}\right)^{-}+\sum_{j=1}^{n-2}\left[b_{j}\left(1-\tau_{j}\right)\right]^{-}+\sum_{i=1}^{m-2}\left[a_{i}\left(1-\sum_{j=1}^{n-2} b_{j}\right)\right]^{-} \tag{19}
\end{equation*}
$$

Then

$$
A \neq B
$$

provided the non-resonance condition (3) holds.
Proof. We note that

$$
\begin{aligned}
A-B & =\left(1-\sum_{j=1}^{n-2} b_{j}\right)+\sum_{j=1}^{n-2} b_{j}\left(1-\tau_{j}\right)+\sum_{i=1}^{m-2} a_{i}\left(1-\sum_{j=1}^{n-2} b_{j}\right) \\
& =1-\sum_{j=1}^{n-2} b_{j}+\sum_{j=1}^{n-2} b_{j}-\sum_{j=1}^{n-2} b_{j} \tau_{j}+\sum_{i=1}^{m-2} a_{i}\left(1-\sum_{j=1}^{n-2} b_{j}\right) \\
& =1-\sum_{j=1}^{n-2} b_{j} \tau_{j}+\left(\sum_{i=1}^{m-2} a_{i}\right)\left(1-\sum_{j=1}^{n-2} b_{j}\right) \neq 0
\end{aligned}
$$

in view of the non-resonance assumption (3). Hence $A \neq B$. This completes the proof of the lemma.

Let us define $\sigma^{*}$ by

$$
\begin{equation*}
\sigma^{*}=\min \left\{\frac{A}{B}, \frac{B}{A}\right\} \in[0,1) \tag{20}
\end{equation*}
$$

where $A, B$ are defined in Lemma 2. Accordingly, we see that $\sigma^{*} \in[0,1)$. Furthermore, in view of (5) we have $\tilde{\alpha}\left(\sigma^{*}\right)<1$.

Let $\varepsilon>0$ be such that $\tilde{\alpha}\left(\sigma^{*}\right)+\varepsilon<1$ and let the constant $C_{\varepsilon}$ be such that

$$
\begin{equation*}
\varphi\left(\sigma^{*} z\right) \leqslant\left(\tilde{\alpha}\left(\sigma^{*}\right)+\varepsilon\right) \varphi(z)+C_{\varepsilon} \quad \text { for every } z \in \mathbb{R} \tag{21}
\end{equation*}
$$

Theorem 3. Let assumption (c) hold. Also let the function $x$ be such that $x$, $x^{\prime}$ is absolutely continuous on $[0,1]$ with $\left(\varphi\left(x^{\prime}\right)\right)^{\prime} \in L^{1}(0,1)$ and $x(0)=\sum_{i=1}^{m-2} a_{i} x^{\prime}\left(\xi_{i}\right)$, $x(1)=\sum_{j=1}^{n-2} b_{j} x\left(\tau_{j}\right)$. Then

$$
\begin{equation*}
\left\|\varphi\left(x^{\prime}\right)\right\|_{\infty} \leqslant \frac{1}{1-\tilde{\alpha}\left(\sigma^{*}\right)-\varepsilon}\left\|\left(\varphi\left(x^{\prime}\right)\right)^{\prime}\right\|_{L^{1}(0,1)}+\frac{C_{\varepsilon}}{1-\tilde{\alpha}\left(\sigma^{*}\right)-\varepsilon} \tag{22}
\end{equation*}
$$

where $\varepsilon$ and $C_{\varepsilon}$ are as in (21).
Proof. For $j=1,2, \ldots, n-2$ we see using the mean value theorem that there exist $\lambda_{j}$ in $[0,1]$ such that

$$
x(1)-x\left(\tau_{j}\right)=\left(1-\tau_{j}\right) x^{\prime}\left(\lambda_{j}\right)
$$

and we see using $x(1)=\sum_{j=1}^{n-2} b_{j} x\left(\tau_{j}\right)$ that

$$
\begin{equation*}
\left(\sum_{j=1}^{n-2} b_{j}-1\right) x(1)=\sum_{j=1}^{n-2} b_{j}\left(1-\tau_{j}\right) x^{\prime}\left(\lambda_{j}\right) \tag{23}
\end{equation*}
$$

Also, we see that there exists a $\lambda \in[0,1]$ such that

$$
\begin{equation*}
x(1)-x(0)=x^{\prime}(\lambda) . \tag{24}
\end{equation*}
$$

Now, we see from equations (23), (24) that

$$
\begin{aligned}
\left(\sum_{j=1}^{n-2} b_{j}-1\right) x^{\prime}(\lambda) & =\left(\sum_{j=1}^{n-2} b_{j}-1\right)(x(1)-x(0)) \\
& =\sum_{j=1}^{n-2} b_{j}\left(1-\tau_{j}\right) x^{\prime}\left(\lambda_{j}\right)-\left(\sum_{j=1}^{n-2} b_{j}-1\right)\left(\sum_{i=1}^{m-2} a_{i} x^{\prime}\left(\xi_{i}\right)\right) \\
& =\sum_{j=1}^{n-2} b_{j}\left(1-\tau_{j}\right) x^{\prime}\left(\lambda_{j}\right)+\left(\sum_{i=1}^{m-2} a_{i}\left(1-\sum_{j=1}^{n-2} b_{j}\right) x^{\prime}\left(\xi_{i}\right)\right)
\end{aligned}
$$

It follows that

$$
\left(1-\sum_{j=1}^{n-2} b_{j}\right) x^{\prime}(\lambda)+\sum_{j=1}^{n-2} b_{j}\left(1-\tau_{j}\right) x^{\prime}\left(\lambda_{j}\right)+\sum_{i=1}^{m-2} a_{i}\left(1-\sum_{j=1}^{n-2} b_{j}\right) x^{\prime}\left(\xi_{i}\right)=0 .
$$

Similar to the proof of Theorem 1 (see (14)), we use (18), (19) and the intermediate value theorem to see that there are $v_{1}, v_{2}$ in $[0,1]$ such that

$$
\begin{equation*}
A x^{\prime}\left(v_{1}\right)-B x^{\prime}\left(v_{2}\right)=0 \tag{25}
\end{equation*}
$$

Suppose now that one of $x^{\prime}\left(v_{1}\right), x^{\prime}\left(v_{2}\right)$ is zero. We then see from one of the equation

$$
\begin{equation*}
\varphi\left(x^{\prime}(t)\right)=\varphi\left(x^{\prime}\left(v_{k}\right)\right)+\int_{v_{k}}^{t}\left(\varphi\left(x^{\prime}\right)\right)^{\prime}(s) \mathrm{d} s, \quad k=1,2, \quad t \in[0,1] \tag{26}
\end{equation*}
$$

that

$$
\begin{equation*}
\left\|\varphi\left(x^{\prime}\right)\right\|_{\infty} \leqslant\left\|\left(\varphi\left(x^{\prime}\right)\right)^{\prime}\right\|_{L^{1}(0,1)} \tag{27}
\end{equation*}
$$

Let us, next, suppose that both $x^{\prime}\left(v_{1}\right), x^{\prime}\left(v_{2}\right)$ are non-zero. Since now $A \neq B$, in view of Lemma 2 we see from equation (25) that

$$
x^{\prime}\left(v_{1}\right) \neq x^{\prime}\left(v_{2}\right) .
$$

We now use the equations

$$
\begin{aligned}
\varphi\left(x^{\prime}(t)\right) & =\varphi\left(x^{\prime}\left(v_{1}\right)\right)+\int_{v_{k}}^{t}\left(\varphi\left(x^{\prime}\right)\right)^{\prime}(s) \mathrm{d} s=\varphi\left(\frac{B}{A} x^{\prime}\left(v_{2}\right)\right)+\int_{v_{k}}^{t}\left(\varphi\left(x^{\prime}\right)\right)^{\prime}(s) \mathrm{d} s \\
\varphi\left(x^{\prime}(t)\right) & =\varphi\left(x^{\prime}\left(v_{2}\right)\right)+\int_{v_{k}}^{t}\left(\varphi\left(x^{\prime}\right)\right)^{\prime}(s) \mathrm{d} s=\varphi\left(\frac{A}{B} x^{\prime}\left(v_{1}\right)\right)+\int_{v_{k}}^{t}\left(\varphi\left(x^{\prime}\right)\right)^{\prime}(s) \mathrm{d} s
\end{aligned}
$$

along with the definition of $\sigma^{*}$ given in (20), (21) and the estimate (27) to obtain the estimate (22). This completes the proof of the theorem.

## 3. Existence Theorem

Let $\varphi$ be an odd increasing homeomorphism from $\mathbb{R}$ onto $\mathbb{R}, f:[0,1] \times \mathbb{R} \times \mathbb{R} \rightarrow \mathbb{R}$ a function satisfying the Carathéodory conditions and $e:[0,1] \rightarrow \mathbb{R}$ a function in $L^{1}[0,1]$. Let assumption (c) hold.

Theorem 4. Let $f:[0,1] \times \mathbb{R} \times \mathbb{R} \rightarrow \mathbb{R}$ be a function satisfying the Carathéodory conditions such that there exist non-negative functions $d_{1}(t), d_{2}(t)$ and $r(t)$ in $L^{1}(0,1)$ such that

$$
|f(t, u, v)| \leqslant d_{1}(t) \varphi(|u|)+d_{2}(t) \varphi(|v|)+r(t)
$$

for a.e. $t \in[0,1]$ and all $u, v \in \mathbb{R}$. Suppose, further, that

$$
\begin{equation*}
\alpha(M)\left\|d_{1}\right\|_{L^{1}(0,1)}+\left\|d_{2}\right\|_{L^{1}(0,1)}<1-\tilde{\alpha}\left(\sigma^{*}\right) \tag{28}
\end{equation*}
$$

where $M$ is defined in Theorem 1, $\alpha(M)$ is defined in (4), $\sigma^{*}$ and $\tilde{\alpha}\left(\sigma^{*}\right)$ are defined in (20), (21). Then, for every given function $e(t) \in L^{1}[0,1]$, the boundary value problem (1) has at least one solution $x \in C^{1}[0,1]$.

Proof. We consider the family of boundary value problems

$$
\begin{gather*}
\left(\varphi\left(x^{\prime}\right)\right)^{\prime}=\lambda f\left(t, x, x^{\prime}\right)+\lambda e(t), \quad \text { a.e. on }[0,1], \lambda \in[0,1],  \tag{29}\\
x(0)=\sum_{i=1}^{m-2} a_{i} x^{\prime}\left(\xi_{i}\right), \quad x(1)=\sum_{j=1}^{n-2} b_{j} x\left(\tau_{j}\right) .
\end{gather*}
$$

Also, we define an operator $\Psi: C^{1}[0,1] \times[0,1] \rightarrow C^{1}[0,1]$ by setting for $(x, \lambda) \in$ $C^{1}[0,1] \times[0,1]$

$$
\begin{align*}
\Psi(x, \lambda)(t)= & x(0)+\int_{0}^{t} \varphi^{-1}\left(\varphi\left(x^{\prime}(0)\right)+\lambda \int_{0}^{s}\left(f\left(\tau, x(\tau), x^{\prime}(\tau)\right)+e(\tau)\right) \mathrm{d} \tau\right) \mathrm{d} s  \tag{30}\\
& +\left(x(0)-\sum_{i=1}^{m-2} a_{i} x^{\prime}\left(\xi_{i}\right)\right)+t\left(x(1)-\sum_{j=1}^{n-2} b_{j} x\left(\tau_{j}\right)\right) .
\end{align*}
$$

Let us suppose that $x \in C^{1}[0,1]$ is a solution to the operator equation, for some $\lambda \in[0,1]$,

$$
\begin{equation*}
x=\Psi(x, \lambda) . \tag{31}
\end{equation*}
$$

Solving equation (31) at $t=0$ we see that $x$ satisfies the boundary condition

$$
x(0)=\sum_{i=1}^{m-2} a_{i} x^{\prime}\left(\xi_{i}\right)
$$

Next, we differentiate equation (31) with respect to $t$ to get

$$
\begin{align*}
\varphi\left(x^{\prime}(t)\right)= & \varphi\left(x^{\prime}(0)\right)+\lambda \int_{0}^{t}\left(f\left(\tau, x(\tau), x^{\prime}(\tau)\right)+e(\tau)\right) \mathrm{d} \tau  \tag{32}\\
& +x(1)-\sum_{j=1}^{n-2} b_{j} x\left(\tau_{j}\right)
\end{align*}
$$

Solving now equation (32) at $t=0$ we see that $x$ satisfies the boundary condition

$$
x(1)=\sum_{j=1}^{n-2} b_{j} x\left(\tau_{j}\right),
$$

and differentiating equation (32) with respect to $t$ we get

$$
\left(\varphi\left(x^{\prime}(t)\right)\right)^{\prime}=\lambda f\left(t, x(t), x^{\prime}(t)\right)+\lambda e(t) \quad \text { for a.e. } t \in[0,1] \text { and each } \lambda \in[0,1]
$$

Thus we see that if $x \in C^{1}[0,1]$ is a solution to the operator equation $x=\Psi(x, \lambda)$ for some $\lambda \in[0,1]$ then $x$ is a solution to the boundary value problems (29) for the same $\lambda \in[0,1]$. Conversely, it is easy to see that if $x \in C^{1}[0,1]$ is a solution to the boundary value problems (29) for some $\lambda \in[0,1]$ then $x \in C^{1}[0,1]$ is a solution to the operator equation $x=\Psi(x, \lambda)$ for the same $\lambda \in[0,1]$.

Next, it is easy to show, following standard arguments, that $\Psi: C^{1}[0,1] \times[0,1] \rightarrow$ $C^{1}[0,1]$ is a completely continuous operator.

We shall next show that there is a constant $R>0$, independent of $\lambda \in[0,1]$, such that if $x \in C^{1}[0,1]$ is a solution to (31), equivalently to the boundary value problem (29), for some $\lambda \in[0,1]$, then $\|x\|_{C^{1}[0,1]}<R$.

We note first that if $x \in C^{1}[0,1]$ satisfies

$$
\begin{equation*}
x=\Psi(x, 0) \tag{33}
\end{equation*}
$$

then $x(t)=0$ for all $t \in[0,1]$. Indeed, from the definition of $\Psi$ or from the boundary value problem (29) it follows that $x(t)=x(0)+x^{\prime}(0) t$. It then follows from the two boundary conditions in (29) and the non-resonance assumption (3) that $x(0)=$ $x^{\prime}(0)=0$, which implies that $x(t)=0$ for all $t \in[0,1]$.

We shall assume now that $\lambda \in(0,1]$. We shall also assume that $\sigma^{*}$, as defined in (20), is positive, since the proof for the case $\sigma^{*}=0$ is simpler. Let us choose $\varepsilon>0$ such that $\tilde{\alpha}\left(\sigma^{*}\right)+\varepsilon<1$ and

$$
\begin{equation*}
(\alpha(M)+\varepsilon)\left\|d_{1}\right\|_{L^{1}(0,1)}+\left\|d_{2}\right\|_{L^{1}(0,1)}<1-\tilde{\alpha}\left(\sigma^{*}\right)-\varepsilon, \tag{34}
\end{equation*}
$$

which is possible to do in view of our assumption (28). Here $M$ is defined in Theorem 1 and $\alpha(M)$ is defined in (4) so that for the $\varepsilon>0$ chosen above there exists a constant $C_{\varepsilon}^{1}>0$ such that

$$
\begin{equation*}
\varphi(M z) \leqslant(\alpha(M)+\varepsilon) \varphi(z)+C_{\varepsilon}^{1} \quad \text { for every } z \in \mathbb{R} \tag{35}
\end{equation*}
$$

Also, from Theorem 3 we see that for the chosen $\varepsilon>0$ there is a constant $C_{\varepsilon}^{2}>0$ such that

$$
\begin{equation*}
\varphi\left(\left\|x^{\prime}\right\|_{\infty}\right) \leqslant \frac{1}{1-\tilde{\alpha}\left(\sigma^{*}\right)-\varepsilon}\left\|\left(\varphi\left(x^{\prime}\right)\right)^{\prime}\right\|_{L^{1}(0,1)}+C_{\varepsilon}^{2} \tag{36}
\end{equation*}
$$

We now see from the equation in (29), using our assumptions on the function $f$, Theorem 1, and estimates (35), (36) that

$$
\begin{aligned}
\left\|\left(\varphi\left(x^{\prime}\right)\right)^{\prime}\right\|_{L^{1}(0,1)} \leqslant & \varphi\left(\|x\|_{\infty}\right)\left\|d_{1}\right\|_{L^{1}(0,1)}+\varphi\left(\left\|x^{\prime}\right\|_{\infty}\right)\left\|d_{2}\right\|_{L^{1}(0,1)} \\
& +\|r\|_{L^{1}(0,1)}+\|e\|_{L^{1}(0,1)} \\
\leqslant & \left.\varphi\left(M\left\|x^{\prime}\right\|_{\infty}\right)\left\|d_{1}\right\|_{L^{1}(0,1)}+\varphi\left\|x^{\prime}\right\|_{\infty}\right)\left\|d_{2}\right\|_{L^{1}(0,1)} \\
& +\|r\|_{L^{1}(0,1)}+\|e\|_{L^{1}(0,1)} \\
\leqslant & \left((\alpha(M)+\varepsilon)\left\|d_{1}\right\|_{L^{1}(0,1)}+\left\|d_{2}\right\|_{L^{1}(0,1)}\right) \varphi\left(\left\|x^{\prime}\right\|_{\infty}\right) \\
& +\|r\|_{L^{1}(0,1)}+\|e\|_{L^{1}(0,1)}+C_{\varepsilon}^{1}\left\|d_{1}\right\|_{L^{1}(0,1)} \\
\leqslant & \left.\frac{(\alpha(M)+\varepsilon)\left\|d_{1}\right\|_{L^{1}(0,1)}+\left\|d_{2}\right\|_{L^{1}(0,1)}\left\|\left(\varphi\left(x^{\prime}\right)\right)^{\prime}\right\|_{L^{1}(0,1)}+C_{\varepsilon}}{1-\tilde{\alpha}\left(\sigma^{*}\right)-\varepsilon}\right)
\end{aligned}
$$

where $C_{\varepsilon}=\|r\|_{L^{1}(0,1)}+\|e\|_{L^{1}(0,1)}+C_{\varepsilon}^{1}\left\|d_{1}\right\|_{L^{1}(0,1)}+C_{\varepsilon}^{2}\left[(\alpha(M)+\varepsilon)\left\|d_{1}\right\|_{L^{1}(0,1)}+\right.$ $\left.\left\|d_{2}\right\|_{L^{1}(0,1)}\right]$. It follows from (34) that there exists a constant $R_{0}$, independent of $\lambda \in[0,1]$, such that if $x \in C^{1}[0,1]$ is a solution to the boundary value problem (29) for some $\lambda \in[0,1]$ then

$$
\left\|\left(\varphi\left(x^{\prime}\right)\right)^{\prime}\right\|_{L^{1}(0,1)} \leqslant R_{0} .
$$

This combined with (36) and (7) gives that there exists a constant $R>0$ such that

$$
\|x\|_{C^{1}[0,1]}<R .
$$

This then implies that $\operatorname{deg}_{\mathrm{LS}}(I-\Psi(\cdot, \lambda), B(0, R), 0)$ is well-defined for all $\lambda \in[0,1]$, where $B(0, R)$ is the ball with center 0 and radius $R$ in $C^{1}[0,1]$. Here $I$ denotes the identity mapping from $C^{1}[0,1]$ onto $C^{1}[0,1]$ and $\operatorname{deg}_{\text {LS }}$ denotes the Leray-Schauder degree.

Let $X$ denote the two-dimensional subspace of $C^{1}[0,1]$ given by

$$
\begin{equation*}
X=\{\alpha+\beta t \text { for } \alpha, \beta \in \mathbb{R}\} . \tag{37}
\end{equation*}
$$

Let us define the isomorphism $i: \mathbb{R}^{2} \rightarrow X$ by

$$
\begin{equation*}
i\binom{\alpha}{\beta}=i_{\binom{\alpha}{\beta}} \in X \quad \text { for }\binom{\alpha}{\beta} \in \mathbb{R}^{2}, \tag{38}
\end{equation*}
$$

where

$$
\begin{equation*}
i_{\binom{\alpha}{\beta}}(t)=\alpha+\beta t \quad \text { for } t \in[0,1] . \tag{39}
\end{equation*}
$$

Also, we define a $2 \times 2$ matrix $\mathbb{A}$ by setting

$$
\mathbb{A}=\left(\begin{array}{cc}
-1 & \sum_{i=1}^{m-2} a_{i}  \tag{40}\\
-\left(1-\sum_{j=1}^{n-2} b_{j}\right) & -\left(1-\sum_{j=1}^{n-2} b_{j} \tau_{j}\right)
\end{array}\right) .
$$

We note that $\operatorname{det} \mathbb{A}=1-\sum_{j=1}^{n-2} b_{j} \tau_{j}+\left(\sum_{i=1}^{m-2} a_{i}\right)\left(1-\sum_{j=1}^{n-2} b_{j}\right) \neq 0$ in view of the nonresonance assumption (3).

Next, we define a function $G: \mathbb{R}^{2} \rightarrow \mathbb{R}^{2}$ by setting

$$
\begin{equation*}
G\binom{\alpha}{\beta}=\mathbb{A} \cdot\binom{\alpha}{\beta}=\binom{-\alpha+\beta\left(\sum_{i=1}^{m-2} a_{i}\right)}{-\alpha\left(1-\sum_{j=1}^{n-2} b_{j}\right)-\beta\left(1-\sum_{j=1}^{n-2} b_{j} \tau_{j}\right)} \tag{41}
\end{equation*}
$$

for $\binom{\alpha}{\beta} \in \mathbb{R}^{2}$.
We note that for $v(t)=\alpha+\beta t \in X$ we have

$$
(I-\Psi(\cdot, 0))(v)=i_{G\binom{\alpha}{\beta}},
$$

and it follows that

$$
G=i^{-1} \circ\left(\left.(I-\Psi(\cdot, 0))\right|_{X} \circ i .\right.
$$

Now, we see from the homotopy invariance property of the Leray-Schauder degree that

$$
\begin{aligned}
\operatorname{deg}_{\mathrm{LS}}(I-\Psi(\cdot, 1), B(0, R), 0) & =\operatorname{deg}_{\mathrm{LS}}(I-\Psi(\cdot, 0), B(0, R), 0) \\
& =\operatorname{deg}_{\mathrm{B}}\left(I-\left.\Psi(\cdot, 0)\right|_{X}, X \cap B(0, R), 0\right) \\
& =\operatorname{deg}_{\mathrm{B}}(G, \mathbb{B}(0, R), 0)
\end{aligned}
$$

where $\mathbb{B}(0, R)$ denotes the ball of radius $R$ in $\mathbb{R}^{2}$ with center at the origin. Finally, we have, using standard results for the Brouwer degree and denoting it by $\operatorname{deg}_{\mathrm{B}}$ (see [27], [28], [29]), that

$$
\operatorname{deg}_{\mathrm{B}}(G, \mathbb{B}(0, R), 0)=\left\{\begin{aligned}
1, & \text { if } \quad \operatorname{det} \mathbb{A}>0 \\
-1, & \text { if } \operatorname{det} \mathbb{A}<0
\end{aligned}\right.
$$

Accordingly, we see from the non-resonance assumption (3), i.e.,

$$
\operatorname{det} \mathbb{A}=\left(1-\sum_{i=1}^{m-2} a_{i}\right)\left(1-\sum_{j=1}^{n-2} b_{j} \tau_{j}\right)+\left(\sum_{i=1}^{m-2} a_{i} \xi_{i}\right)\left(1-\sum_{j=1}^{n-2} b_{j}\right) \neq 0
$$

that $\operatorname{deg}_{\mathrm{LS}}(I-\Psi(\cdot, 1), B(0, R), 0) \neq 0$ and there is $x \in B(0, R) \subset C^{1}[0,1]$ that satisfies

$$
x=\Psi(x, 1)
$$

equivalently, $x$ is a solution to the boundary value (1). This completes the proof of the theorem.
