INTEGRATION OF A DENSITY AND THE FIBER INTEGRAL FOR REGULAR LIE ALGEBROIDS IN A NONORIENTABLE CASE

URBAŃSKI TOMASZ

Abstract

This paper splits into two parts. The first drives to integral of a density. The second part refers to Lie algebroids. I define an integration operator of A-differential forms with values in an orientation bundle over the bundle of isotropy Lie algebras in vertically oriented Lie algebroid A. I establish five basic properties of this operator, its commutation with an exterior and Lie derivations. Some of them are proved here.

1 Introduction

Basic facts and concepts with respect to Lie algebroids can be found in [2], [3], [1], [4]. Required results referring to vertically oriented Lie algebroids and the fiber integral of \mathbb{R} -valued forms are included in [3].

R.Bott, in the work [5], has defined an integration operation of differential forms on manifolds with values in an orientation bundle. This operation was a tool to cohomological researches of nonorientable manifolds. The aim of the presented work is to introduce an analogous fiber integral of or_M -valued forms on the ground of regular Lie algebroids with usage of ideas which comes from works [3] and [5].

In perspective, this work drives to an examination of a cohomology algebra of a regular Lie algebroid over a nonoriented base manifold.

In this paper we associate *n*-dimensional manifolds M and N with differential structures $\mathfrak{A} = \{(U_{\alpha}, x_{\alpha})\}_{\alpha \in I}$ and $\mathfrak{B} = \{(V_{\beta}, y_{\beta})\}_{\beta \in J}$ respectively.

2 Differential Forms with Values in an Orientation Bundle

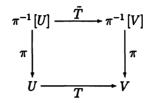

2.1 Pullback of Forms with Values in an Orientation Bundle

Consider an orientation bundle or_N of the differential manifold N [5]. Let $\Omega(N; or_N)$ be the vector space of differential forms on N with values in the orientation bundle or_N . So, k-form Φ is a global section of the vector bundle

$$\bigwedge^{k} T^*N \otimes \operatorname{or}_{N}.$$

Pointwise we have $\Phi_q : \bigwedge^k T_q N \to \operatorname{or}_N|_q$. In many sources an element of the $\Omega(N; \operatorname{or}_N)$ is also called a *density*.

To define a pullback operation assume that U is an open subset of M, V is an open subset of N and $T: U \to V$ is a diffeomorphism. Then, it is easy to show, that there exist an induced isomorphism of vector bundles $\tilde{T}: \operatorname{or}_M|_U \to \operatorname{or}_N|_V$ such that the diagram

commutes. Knowing that, for arbitrary $\Phi \in \Omega^k(N; \operatorname{or}_N)$ we define a form $T^*\Phi \in \Omega^k(U; \operatorname{or}_M|_U)$ by a formula

$$(T^*_{,\bullet}\Phi)_p(v_1\wedge\ldots\wedge v_k)=\tilde{T}_p^{-1}\left(\Phi_{T(p)}\left(T_{*p}v_1\wedge\ldots\wedge T_{*p}v_k\right)\right), \qquad p\in U.$$

If we suppose that $\omega \in \Omega^k(N)$, $e \in \operatorname{Sec} \operatorname{or}_N$, it is natural to define a form $\omega \otimes e \in \Omega^k(N; \operatorname{or}_N)$ by

$$(\omega \otimes e)_q = \omega_q \otimes e_q : \bigwedge^k T_q N \longrightarrow \operatorname{or}_N|_q$$
$$v_1 \wedge \ldots \wedge v_k \longmapsto \omega_q (v_1 \wedge \ldots \wedge v_k) \cdot e_q.$$

Than for any $p \in U$ holds an equality

$$(T^*(\omega \otimes e))_p = (T^*\omega)_p \otimes \tilde{T}_p^{-1}(e_{T(p)}).$$
(1)

For each $\alpha \in I$ denote by e_{α} the map given by

$$\begin{array}{cccc} e_{\alpha}: U_{\alpha} & \longrightarrow & \mathrm{or}_{M} \\ p_{\cdot} & \longmapsto & [(\alpha, p, 1)]^{\cdot}. \end{array} \end{array}$$

$$(2)$$

It states the vector basis of a module $\operatorname{Sec} \operatorname{or}_M|_{U_\alpha}$. Assume in addition $x_\alpha = (x_1^\alpha, \ldots, x_n^\alpha)$ is a local coordinate map of the manifold M corresponding to α and ω is a form given by $dx_1^\alpha \wedge \ldots \wedge dx_n^\alpha$. Then we define a form $|dx_1^\alpha \wedge \ldots \wedge dx_n^\alpha|$ with values in an orientation bundle or_M , by

$$|dx_1^{\alpha} \wedge \ldots \wedge dx_n^{\alpha}| = (dx_1^{\alpha} \wedge \ldots \wedge dx_n^{\alpha}) \otimes e_{\alpha}.$$
 (3)

Now we can establish

Proposition 1 Suppose (U_{α}, x_{α}) , (V_{β}, y_{β}) are two charts on M and N respectively, and let $T : U_{\alpha} \to V_{\beta}$ be a diffeomorphism (not necessary orientation-preserving). Then we have a relation

$$T^* \left| dy_1^{eta} \wedge \ldots \wedge dy_n^{eta} \right| = |J(T_{eta lpha})| \cdot |dx_1^{lpha} \wedge \ldots \wedge dx_n^{lpha}|.$$

Indeed, for each $p \in U_{\alpha}$, from (1) and the abvious equality sgn J $(T_{\alpha\beta}^{-1}(T(p))) =$ sgn J $(T_{\beta\alpha}(p))$, we see that

$$\begin{pmatrix} T^* \left| dy_1^{\beta} \wedge \ldots \wedge dy_n^{\beta} \right| \end{pmatrix}_p$$

$$= \left(T^* \left(dy_1^{\beta} \wedge \ldots \wedge dy_n^{\beta} \right) \right)_p \otimes \tilde{T}_p^{-1} \left(e_{\beta} \left(T \left(p \right) \right) \right)$$

$$= \left(T^* \left(dy_1^{\beta} \wedge \ldots \wedge dy_n^{\beta} \right) \right)_p \otimes \left(\operatorname{sgn} J \left(T_{\beta \alpha} \left(p \right) \right) \cdot e_{\alpha} \left(p \right) \right)$$

$$= \left(J \left(T_{\beta \alpha} \left(p \right) \right) \cdot \left(dx_1^{\alpha} \wedge \ldots \wedge dx_n^{\alpha} \right)_p \right) \otimes \left(\operatorname{sgn} J \left(T_{\beta \alpha} \left(p \right) \right) \cdot e_{\alpha} \left(p \right) \right)$$

$$= \left(\operatorname{sgn} J \left(T_{\beta \alpha} \left(p \right) \right) \cdot J \left(T_{\beta \alpha} \left(p \right) \right) \right) \cdot \left(\left(dx_1^{\alpha} \wedge \ldots \wedge dx_n^{\alpha} \right)_p \otimes e_{\alpha} \left(p \right) \right)$$

$$= \left(\left| J \left(T_{\beta \alpha} \right) \right| \cdot \left| dx_1^{\alpha} \wedge \ldots \wedge dx_n^{\alpha} \right| \right)_p .$$

In particular it follows, that if $g \in \Omega^0(N)$ is an arbitrary real function, then

$$T^*\left(g\cdot \left|dy_1^{\beta}\wedge\ldots\wedge dy_n^{\beta}\right|\right)=\left(g\circ T\right)\cdot \left|J\left(T_{\beta\alpha}\right)\right|\left|dx_1^{\alpha}\wedge\ldots\wedge dx_n^{\alpha}\right|.$$

2.2 Integral of a Density

Let pair $(\mathbb{R}^n, y = id)$ be the canonical identity chart, U an open subset of \mathbb{R}^n , and $g \in \Omega^0(U)$ a measurable function on U. We define

$$\int_U g \cdot |dy_1 \wedge \ldots \wedge dy_n| = \int_U g dy_1 \ldots dy_n.$$

Suppose furthermore, that V is an open subset of \mathbb{R}^n , $T: U \to V$ is a diffeomorphism and let $\Phi \in \Omega^n_c(\mathbb{R}^n; \operatorname{or}_{\mathbb{R}^n})$ be such a form, that $\operatorname{supp} \Phi \subset V$. Then, by the classical change of variable formula

$$\int_{U} T^{*} \Phi = \int_{U} (g \circ T) |JT| \cdot |dy_{1} \wedge \ldots \wedge dy_{n}|$$

=
$$\int_{V} g \cdot |dy_{1} \wedge \ldots \wedge dy_{n}|$$

=
$$\int_{V} \Phi.$$

On arbitrary manifold M and a form $\Phi \in \Omega_c^n(M; \operatorname{or}_M)$ we define an integral

$$\int_M \Phi$$

in the following manner

- take an atlas $\{(U_{\alpha}, x_{\alpha})\}_{\alpha \in I}$ (not necessary maximal),
- take a subordinate partition of unity $\{\rho_{\alpha}\}_{\alpha\in I}$,

• assume

$$\int_{M} \Phi = \sum_{\alpha} \int_{x_{\alpha}[U_{\alpha}]} (x_{\alpha}^{-1})^{*} (\rho_{\alpha} \cdot \Phi) \,.$$

It can be easily shown, that above definition doesn't depend on choice of the atlas and the patition of unity.

3 Fiber Integral of a Density in a Vertically Oriented Lie Algebroid

3.1 Definition and Basic Properties

Let $\Omega_A(M; \operatorname{or}_M)$ denotes a vector space of A-differential forms with values in an orientation bundle or_M , where A is an arbitrary Lie algebroid over the manifold M, i.e. a space of all cross-sections of $\bigwedge A^* \bigotimes \operatorname{or}_M$.

Definition 1 Suppose in addition, that A' is a second arbitrary Lie algebroid over the manifold N, and $H : A|_U \to A'|_{U'}$ is a homomorphism A in A' inducing a diffeomorphism \hat{H} of open subsets $U \subset M$ on $V \subset N$. Let $\tilde{H} : \operatorname{or}_M|_U \to \operatorname{or}_N|_V$ be the isomorphism of the vector bundles induced by \hat{H} . Then, for each form $\Phi \in \Omega^k_{A'}(N; \operatorname{or}_N)$ we define a form $H^*\Phi \in \Omega^*_A(U; \operatorname{or}_M|_U)$ by

$$(H^*\Phi)_p(t_1\wedge\ldots\wedge t_k)=\tilde{H}_p^{-1}\left(\Phi_{\hat{H}(p)}(Ht_1\wedge\ldots\wedge Ht_k)\right), \qquad p\in U.$$

Definition 2 An ordered pair (A, ε) is called vertically oriented Lie algebroid, if A is a regular Lie algebroid of rank n over a foliated manifold (M, \mathcal{F}) ,

$$0 \to \boldsymbol{g} \hookrightarrow A \xrightarrow{\boldsymbol{\gamma}} \mathcal{F} \to 0$$

is its Atiyah sequence, and ε is nowhere vanishing cross-section of the bundle $\bigwedge^n g$.

Definition 3 Let (A', ε') be one more vertically oriented Lie algebroid over a foliated manifold (A', \mathcal{F}') , and suppose that rank $g = \operatorname{rank} g'$. A homomorphism of Lie algebroids $H : A \to A'$, which induces $\hat{H} : M \to M'$ and fulfils condition

$$\left(\bigwedge^{n} H^{+}\right)(\varepsilon_{p}) = \varepsilon'_{\hat{H}p}, \qquad p \in M$$

is called homomorphism of vertically oriented Lie algebroids (A, ε) into (A', ε') .

Since for any $\Phi \in \Omega^{n+k}_A(M; \operatorname{or}_M), k \ge 0$, the form $\iota_{\varepsilon} \Phi \in \Omega^k_A(M; \operatorname{or}_M)$ defined by

$$(\iota_{\varepsilon}\Phi)_{p}(t_{1}\wedge\ldots\wedge t_{k})=\Phi_{p}(\varepsilon_{p}\wedge t_{1}\wedge\ldots\wedge t_{k}), \qquad p\in M, t_{i}\in A|_{p}$$

is horizontal (i.e. $\iota_h(\iota_{\varepsilon}\Phi) = 0$ for $\eta \in \text{Sec } g$), there exists uniquely determined tangential differential form $\Psi \in \Omega_{\mathcal{F}}^k(M; \operatorname{or}_M)$ such that $\iota_{\varepsilon}\Phi = \gamma^*\Psi$. Assume furthermore, that if deg $\Phi < n$, then $\iota_{\varepsilon}\Phi = 0$.

192

Definition 4 By an integration operator of A-differential forms on M with values in an orientation bundle or_M over the bundle of isotropy Lie algebras g in the vertically oriented Lie algebroid (A, ε) we mean the operator

$$\int_{A} : \Omega^{*}_{A}(M; \operatorname{or}_{M}) \longrightarrow \Omega^{*-n}_{\mathcal{F}}(M; \operatorname{or}_{M})$$

such that for each $\Phi \in \Omega^{n+k}_A(M; \operatorname{or}_M)$ the value $\mathcal{J}_A \Phi \in \Phi^k_{\mathcal{F}}(M; \operatorname{or}_M)$ is the uniquely determined form defined by the formula

$$\gamma^*\left(\int_A\Phi\right)=(-1)^{nk}\imath_{\varepsilon}\Phi.$$

Proposition 2 Integration operator defined above has the following properties

(a) If $H : (A, \varepsilon) \to (A', \varepsilon')$ is a homomorphism of vertically oriented Lie algebroids inducing the diffeomorphism \hat{H} of open subsets $U \subset M$ on $V \subset N$, then there is an equality

$$\hat{H}^* \circ \oint_{A'} = \oint_A \circ H^*$$

on U.

- (b) $\int_A \circ \gamma^* = 0$,
- (c) $\int_{A} \gamma^* \Psi \wedge \phi = \Psi \wedge \int_{A} \phi$ for arbitrary forms $\Psi \in \Omega_{\mathcal{F}}(M; \operatorname{or}_M)$ and $\phi \in \Omega_A(M)$,
- (d) $\int_{A} \phi \wedge \gamma^{*} \Psi = (-1)^{nk} (\int_{A} \phi) \wedge \Psi$ for arbitrary forms $\Psi \in \Omega_{\mathcal{F}}^{k}(M; \operatorname{or}_{M}), \phi \in \Omega_{A}^{\geq n}(M),$
- (e) f_A is an epimorphism.

We will omit proofs of properties (a) and (b) because they are based on simple calculations. Now we will set to proving the formula (c).

Let k, q be arbitrary integer numbers and $\Psi \in \Omega^k_{\mathcal{F}}(M; \operatorname{or}_M), \phi \in \Omega^q_A(M)$. Locally we can write

$$\Psi=\psi\otimes e_{\alpha},$$

where $\psi \in \Omega^k_{\mathcal{F}}(M)$, and e_{α} is defined in (2). Consider two cases

- if k + q < n, then both sides of the proved formula are equal to zero,
- if $k + q \ge n$, then there are two possible situations

1. q < n. Then $\mathcal{J}_{A} \phi = 0$, so it should be proved, that

$$\int_A \gamma^* \Psi \wedge \phi = 0,$$

but it is easy to see by a simple calculation.

2. $q \ge n$. To prove considered formula it is enough to show, that

$$\gamma^*\left(\Psi\wedge \oint_A\phi\right)=(-1)^{n(k+q-n)}\imath_{\varepsilon}\left(\gamma^*\Psi\wedge\phi\right).$$

To see it, let $p \in M$ be an arbitrary point and $t_i \in A|_p$, i = 1, ..., k + q be such that $\varepsilon_p = t_1 \land ... \land t_n$. Then

$$\left(\gamma^* \left(\Psi \wedge \int_A \phi\right)\right)_p (t_{n+1} \wedge \ldots \wedge t_{k+q})$$

$$= \left(\gamma^* \Psi \wedge \gamma^* \int_A \phi\right)_p (t_{n+1} \wedge \ldots \wedge t_{k+q})$$

$$= \left(\gamma^* \Psi \wedge (-1)^{n(q-n)} \imath_e \phi\right)_p (t_{n+1} \wedge \ldots \wedge t_{k+q})$$

$$= (-1)^{n(q-n)+k(q-n)} (\imath_e \phi \wedge \gamma^* \Psi)_p (t_{n+1} \wedge \ldots \wedge t_{k+q})$$

$$= (-1)^{n(q-n)+k(q-n)} (\phi \wedge \gamma^* \Psi)_p (t_1 \wedge \ldots \wedge t_{k+q})$$

$$= (-1)^{n(q-n)+k(q-n)+qk} (\gamma^* \Psi \wedge \phi)_p (t_1 \wedge \ldots \wedge t_{k+q})$$

$$= (-1)^{n(k+q-n)} \imath_e (\gamma^* \Psi \wedge \phi)_p (t_{n+1} \wedge \ldots \wedge t_{k+q}).$$

Property (d) is a simple corollary of the formula (c), which we have just proved.

To show the property (e), let consider a section $\sigma \in \text{Sec} \bigwedge^n g^*$ such that $\iota_{\varepsilon}\sigma = 1$ and a form of the connection $\kappa : A \to g$ (than $\kappa|_g = id$). Than for arbitrary $\Psi \in \Omega_{\mathcal{F}}(M; \text{or}_M)$ there holds an equality

$$\int_A \gamma^* \Psi \wedge \kappa^* \sigma = \Psi.$$

Indeed,

$$\int_A \gamma^* \Psi \wedge \kappa^* \sigma = \Psi \wedge \int_A \kappa^* \sigma,$$

but

$$\gamma^*\left(\int_A \kappa^*\sigma\right) = (-1)^{n\cdot 0} \imath_{\varepsilon} \left(\kappa^*\sigma\right) = \sigma \left(\kappa \circ \varepsilon\right) = \sigma \left(\varepsilon\right) = 1.$$

4 Commutation of the Integration Operator with Derivatives

4.1 Construction of exterior derivatives and Lie derivatives

Let $X \in \mathfrak{X}(M)$ be an arbitrary vector field, $\alpha \in I$ be any index, $f \in C^{\infty}(U_{\alpha})$ and $e_{\alpha}: U_{\alpha} \to \operatorname{or}_{M}$. Then the formula

$$\nabla_X \left(f e_\alpha \right) = X \left(f \right) \cdot e_\alpha,$$

and

Remark 1 Incidentally, there is an exterior derivation operator $d : \Omega^*(M; \operatorname{or}_M) \to \Omega^{*+1}(M; \operatorname{or}_M)$ locally defined, over U_{α} by

$$d\left(\omega\otimes e_{lpha}
ight)=\left(d\omega
ight)\otimes e_{lpha}$$

in the R. Bott's book [5, p. 80]. See, that operator d_F^{sc} states its interpretation in the names of algebroids.

Proposition 3 There holds an equality

$$\gamma^* \circ d_{\mathcal{F}}^{\mathrm{or}} = d_A^{\mathrm{or}} \circ \gamma^*, \tag{4}$$

where $\gamma: A \to \mathcal{F}$ is an anchor.

4.2 Theorems of a Destination

Theorem 4 The integration operator f_A of A-differential forms on M with values in an orientation bundle or_M over the bundle of isotropy algebras g in the vertically oriented Lie algebroid (A, ε) commutes with exterior derivatives

$$d_{\mathcal{F}}^{\text{or}} \circ \int_{A} = \int_{A} \circ d_{A}^{\text{or}} \tag{5}$$

if and only if

- (a1) the isotropy Lie algebras $g|_p$ are unimodular, and
- (a2) the cross-section ε is invariant with respect to the adjoint representation of A on $\bigwedge^n g$.

defines in a proper way the covariant derivative

$$\nabla : \mathfrak{X}(M) \times \operatorname{Sec} \operatorname{or}_M \longrightarrow \operatorname{Sec} \operatorname{or}_M.$$

Hence, the map

$$\lambda^{\nabla}: TM \longrightarrow A(\mathrm{or}_M)$$

defined by

$$\lambda^{
abla}\left(v
ight)=
abla_{v}\left(\cdot
ight),\qquad v\in TM$$

is a connection in the regular Lie algebroid $A(\operatorname{or}_M)$. Since ∇ is a flat connection, λ^{∇} is a homomorphism of the Lie algebroids, whence the map

$$L: A \to A(\mathrm{or}_M)$$

defined by the formula

 $L = \lambda^{\nabla} \circ \gamma$

states a representation of the Lie algebroid A in the orientation bundle or_M (for the definition of a representation see [4]).

Now we have operators

$$\begin{pmatrix} \theta_{\mathcal{F}}^{\mathrm{or}} \end{pmatrix}_{X} : \Omega_{\mathcal{F}}(M; \mathrm{or}_{M}) \longrightarrow \Omega_{\mathcal{F}}(M; \mathrm{or}_{M}), \\ \begin{pmatrix} \theta_{A}^{\mathrm{or}} \end{pmatrix}_{n} : \Omega_{A}(M; \mathrm{or}_{M}) \longrightarrow \Omega_{A}(M; \mathrm{or}_{M}),$$

and

$$\begin{aligned} d^{\mathrm{or}}_{\mathcal{F}} &: \quad \Omega_{\mathcal{F}}\left(M; \mathrm{or}_{M}\right) \longrightarrow \Omega_{\mathcal{F}}\left(M; \mathrm{or}_{M}\right), \\ d^{\mathrm{or}}_{A} &: \quad \Omega_{A}\left(M; \mathrm{or}_{M}\right) \longrightarrow \Omega_{A}\left(M; \mathrm{or}_{M}\right) \end{aligned}$$

called Lie derivatives (with respect to the \mathcal{F} -tangent field X, and the cross-section $\eta \in \text{Sec } A$ respectively), and exterior derivatives respectively, described by the formulae

$$\begin{aligned} (\theta_{\mathcal{F}}^{\mathrm{or}})_{X} \left(\Psi\right) \left(X_{1} \wedge \ldots \wedge X_{k}\right) &= \mathcal{L}_{\lambda^{\nabla}|_{\mathcal{F}} \circ X} \left(\Psi\left(X_{1} \wedge \ldots \wedge X_{k}\right)\right) + \\ &- \sum_{i=1}^{k} \Psi\left(X_{1} \wedge \ldots \wedge [X, X_{i}] \wedge \ldots \wedge X_{k}\right) \\ (\theta_{A}^{\mathrm{or}})_{\eta} \left(\Phi\right) \left(\eta_{1} \wedge \ldots \wedge \eta_{k}\right) &= \mathcal{L}_{Lo\eta} \left(\Phi\left(\eta_{1} \wedge \ldots \wedge \eta_{k}\right)\right) + \\ &- \sum_{i=1}^{k} \Phi\left(\eta_{1} \wedge \ldots \wedge [\eta, \eta_{i}] \wedge \ldots \wedge \eta_{k}\right), \end{aligned}$$

196

It is easy to see that γ^* is a monomorphism. So, we can express proved equality in a form

$$\gamma^*\left(d_{\mathcal{F}}^{\mathrm{or}} \oint_A \Phi\right) = \gamma^*\left(\oint_A \left(d_A^{\mathrm{or}} \Phi\right)\right), \qquad \Phi \in \Omega_A\left(M; \mathrm{or}_M\right).$$

Next, from (4) we obtain the following appearance of the proved formula

$$d_A^{\mathrm{or}}\left(\gamma^*\left(\int_A\Phi
ight)
ight)=\gamma^*\left(\int_A(d_A^{\mathrm{or}}\Phi)
ight),\qquad\Phi\in\Omega_A\left(M;\mathrm{or}_M
ight).$$

Finally, from the definition of an operator \mathcal{J}_A we see, that we can focus below on the equality

$$d_{A}^{\mathrm{or}} \circ \imath_{\varepsilon} (\Phi) = (-1)^{n} \imath_{\varepsilon} \circ d_{A}^{\mathrm{or}} (\Phi), \qquad \Phi \in \Omega_{A} (M; \mathrm{or}_{M}).$$
(6)

It ensue from the definition of the operator i, that if deg $\Phi < n - 1$, then both sides of (6) are permanent equal to zero. The same argument proves, that when $\deg \Phi = n - 1$, then equality (6) refines to formula

$$\iota_{\varepsilon} \circ d_A^{\mathrm{or}}(\Phi) = 0, \qquad \Phi \in \Omega_A^{n-1}(M; \mathrm{or}_M).$$

Further, we have to give two technical lemmas.

Lemma 5 Equality (6) takes place for each form $\Phi \in \Omega_A^{n+k}(M; \operatorname{or}_M)$ $(k \ge 0$ is fixed, and $n + k \leq \operatorname{rank} A$ if and only if for arbitrary sections $\xi_1, \ldots, \xi_{k+1} \in SecA$ and for arbitrary chosen neighbourhood $U \subset M$ on which $\varepsilon = \sigma_1 \land \ldots \land \sigma_n$ for some $\sigma_i \in \text{Sec } g$ (each point $p \in M$ has a neighbourhood U, for which ε is in such a form), holds the following equality

$$0 = \left(\sum_{i < j} (-1)^{i+j} [\sigma_i, \sigma_j] \wedge \sigma_1 \wedge \ldots \wedge \hat{\sigma}_i \wedge \ldots \wedge \hat{\sigma}_j \wedge \ldots \wedge \sigma_n\right) \wedge \\ \wedge \xi_1 \wedge \ldots \wedge \xi_{k+1} + \sum_j (-1)^{j+n} \left(\sum_i \sigma_1 \wedge \ldots \wedge [[\xi_j, \sigma_i]] \wedge \ldots \wedge \sigma_n\right) \wedge \\ \wedge \xi_1 \wedge \ldots \wedge \hat{\xi}_j \wedge \ldots \wedge \xi_{k+1}.$$

Lemma 6 Equality (6) takes place for each form $\Phi \in \Omega_A^{n-1}(M; \operatorname{or}_M)$ if and only if

$$\sum_{i < j} (-1)^{i+j} \left(\left[\sigma_i, \sigma_j \right] \land \sigma_1 \land \ldots \land \hat{\sigma}_i \land \ldots \land \hat{\sigma}_j \land \ldots \land \sigma_n \right) \bigg|_U = 0$$

(when U and σ_i are such, as in the above lemma) or equivalently, when $g|_{n,p} \in M$ is unimodular.

URBAŃSKI TOMASZ

Now, suppose that holds the equality (5). Considering forms of degree n-1, we obtain from the first lemma, unimodularity of $g|_p$, $p \in M$. Taking it under consideration, for arbitrary form of degree n (i.e. k = 0), in view of the second lemma, we get the equality

$$\sum_{i} \sigma_{1} \wedge \ldots \wedge [\eta, \sigma_{i}] \wedge \ldots \wedge \sigma_{n} \bigg|_{U} = 0, \qquad \eta \in \operatorname{Sec} A,$$

which implies, that

$$\left. \bigwedge^{n} \operatorname{ad}_{A} \left(\eta
ight) (\varepsilon)
ight|_{U} = 0,$$

i.e. the invariance of the section ε with respect to adjoint representation A in $\bigwedge^n g$.

Assume now, that there hold conditions (a1) and (a2). The unimodularity of $g|_p, p \in M$ gives, according to the second lemma, equality (6) for forms of degree n-1. For forms of degree $\geq n$, the equality (6) follows from the first lemma.

Corollary 7 The integration operator f_A in unimodular invariantly oriented Lie algebroid (A, ε) of A-differential forms on M with values in an orientation bundle or_M over the bundle of isotropy algebras g induces morphism

$$\int_{A}^{\#} : H_{A}^{*}(M; \operatorname{or}_{M}) \longrightarrow H_{\mathcal{F}}^{*-n}(M; \operatorname{or}_{M}),$$

where $H_A(M; \operatorname{or}_M)$, $H_{\mathcal{F}}(M; \operatorname{or}_M)$ are cohomology algebras in the algebra $\Omega_A(M; \operatorname{or}_M)$ with respect to the operator d_A^{or} , and the algebra $\Omega_{\mathcal{F}}(M; \operatorname{or}_M)$ with respect to the operator $d_{\mathcal{F}}^{\operatorname{or}}$ respectively.

Theorem 8 The integration operator f_A in unimodular invariantly oriented Lie algebroid (A, ε) of A-differential forms on M with values in an orientation bundle or_M over the bundle of isotropy algebras g commutes with Lie derivatives

$$(\theta_{\mathcal{F}}^{\mathrm{or}})_X \circ \int_A = \int_A \circ (\theta_A^{\mathrm{or}})_\eta,$$

where $\eta \in \text{Sec } A$ and $X \in \mathfrak{X}(M)$ are γ -related.
