a Class of banach lattices and positive operators

## RYSZARD GRZĄŚLEYICZ

By an operator we mean a bounded linear transformation .
Let $B$ be a real Banach lattice. A set of all positive operators mapring $B$ into $B$ is denoted by $\mathcal{L}_{+}(B)$ i.e. $T \in \mathcal{L}_{+}(B)$ if and only if $m x \geqslant 0$ for all $x \geqslant 0$. We say that a Banach lattice $B$ has the property $W$ if the isometric domain
$M(T)=\{x \in B:\|T x\|=\|T\|\|x\|\}$
is a linear subspace of $B$ for all $T \in \mathcal{L}_{+}(B)$.
In [ $]$ ] it was shown that $L^{p}$-spases , $1<\mathrm{p}<\infty$, have the property $W$. The proof of this result is based on properties of doubly stochastic operators established by Ryff [4],[5]. In the class of Orlicz spaces $L^{\phi}(\mathrm{N})$ (with $\phi: \mathrm{F}_{+} \rightarrow \mathrm{F}_{+}$strictly convex
 have the property $W$ (see [2]). In view of the above facts. it would be interesting to know whether there exist spaces which are not. $\dot{L}^{\text {p}}$-spaces and which have the property $W$.

In this note we give an example of a two dimensional Orlicz space with the property $W$, which is not an $l_{2}^{p}$-space. Next we consider other properties of the two-dimensional Banach lattice with the property $W$.

Theorem 1. Let $B$ be a Banach lattice with the property $\boldsymbol{W}$. Then $B$ is strictly convex.

Proof. To get a contradiction suppose that $B$ is not strictly convex. Then there exist distinct positive vectors $u_{1}, u_{2}$ such that $\left\|a u_{1}+(1-a) u_{2}\right\|^{\prime}=1$ for all $a \in[0,1]$. Let $f \in B^{\#}$ be such that $\|f\|=f\left(u_{1}+u_{2}\right) / 2=1$. Then $f\left(u_{q}\right)=f\left(u_{2}\right)=1$. Obviously $f_{+}\left(u_{1}\right)=f_{+}\left(u_{2}\right)=\left\|f_{+}\right\|=1$. Now consider the operator $T$ defined by $T x=x_{0} f_{+}(x)$, where $x_{0} \in B$ is a fixed vector, $x_{0} \geqslant 0,\left\|x_{0}\right\|=1$. Vie have $u_{1}, u_{2} \in M(T)$ and $u_{1}-u_{2} \notin M(T)$, so $M(T)$ is not a linear space.This contradiction proves our Theorem.

This paper is in final form and no version of it will be submitted for publication elsewhere.

## The two-dimensional case.

Example. Let $B_{o}$ denote $R^{2}$, eouipped with the norm
$\|(x, y)\|=\sqrt{x^{2}+|x y|+y^{2}}$
$(x, y) \in R^{2}$. Obviously $B_{C}$ is not an $1^{p}$-space. Note that $B_{0}$ is an Orlicz space with the Minkowski norm

$$
\|(x, y)\|_{\phi}=\inf _{n}\{\alpha: \phi(|x / \alpha|)+\phi(|y / \alpha|) \leqslant 1\}
$$

where

$$
\phi(t)=\left\{\begin{array}{lll}
\frac{3+\sqrt{3}}{3}\left[2+t-\sqrt{4-3 t^{2}}\right] & \text { for } & 0 \leqslant t \leqslant \frac{\sqrt{3}}{3} \\
\frac{3+\sqrt{3}}{4} t+\frac{1-3}{4} & \text { for } & t \geqslant \frac{\sqrt{3}}{3}
\end{array}\right.
$$

It should be pointed out that each two-dimensiunal Banach lattice with the norm satisfying $\|(x, y)\|=\|(y, x)\|$ is an Crlicz space,witb the Minkowski norm. This description does not extend to 3-dimensional spaces (see [3]).

$$
\text { Let } T=\left[\begin{array}{ll}
a & b \\
c & d
\end{array}\right] \in \mathcal{L}_{+}\left(B_{0}\right) \text {, that is } a, b, c, d \geqslant 0 \text {. We claim }
$$

thet $r(T)$ is a lirear subspace of $B_{0}$. We may and do assume that $\|T\|=1$. If $M(T)$ has exactly one linearly independent vector, then $\mathrm{M}(\mathrm{T})$ is obviously a linear subspace. Thus we need to show that if there are two linearly independent vectors in $M(T)$, say $\left(x_{1}, y_{1}\right)$, $\left(x_{2}, y_{2}\right)$, then $T$ is an isometry. We have $\| T\left((x, y)\left\|^{2} \leqslant\right\|(x, y) \|^{2}\right.$. Thus

$$
A x^{2}+B|x y|+C y^{2} \leqslant x^{2}+|x y|+y^{2}
$$

where $A=a c+a c+c^{2}, B=2 a b+a d+b c+2 c d, C=b^{2}+b d+d^{2}$, and the equality holds for $\left(x_{1}, y_{1}\right)$, $\left(x_{2}, y_{2}\right)$. It is not hard to see that this implies $A=B=C=1$. Therefore $a^{2} b^{2}+c^{2} d^{2}+\left(a^{2}+c^{2}\right) b d+$ $\left(b^{2}+d^{2}\right) a c+3 a b c d=\left(B^{2}-A C\right) / 3=0$. Since $a, b, c, d \geqslant 0$ and $A=C=1$ we obtain $a=d=1, b=c=0$ or $a=d=0, b=c=1$, i.e. T is an isometry . Therefore $B_{0}$ has the property $W$.

Femark. Let $B$ have the property $W$ and $\operatorname{dim} B=2$. Let $T \in \mathcal{L}_{+}(B)$ be such that $T^{-1} \in \mathcal{L}_{+}(B)$. Then either $T /\|T\|$ is an isometry or else there exists exactly one $x_{0}$ such that $x_{0} \geqslant 0,\left\|x_{0}\right\|=1$ and $\left\|T x_{0}\right\|=\inf \{\|T x\|: x \in B,\|x\|=1\}$
Indeed, suppose that $T$ is not an isometry. Then $T^{-1}$ is not an isometry and $\operatorname{dim} M\left(T^{-1}\right)=1$. Let $0 \neq y_{0} \in M\left(T^{-1}\right)$. The vector
$x_{0}=T^{-1}\left(y_{0}\right) /\left\|T^{-1}\left(y_{0}\right)\right\|$ satisfies the above equality.
Theorem 2. Let $\left(R^{2},\|\cdot\|\right)$ have the property N and let $\|(1,0)\|=\|(0,1)$ ) Then $\|(x, y)\|=\|(y, x)\|$ for all $x, y \in R$.
Proof. Consider the operator $T_{a}=\left[\begin{array}{cc}0 & 2-a \\ a & 0\end{array}\right]$. We clanm that $T_{a}$ is an isometry for some $a \in[U, 2]$. To get a contradiction suppose that $\operatorname{dim} M\left(T_{a}\right)=1$ for all $a \in[0,2]$. Put

$$
e_{\alpha}=(\cos \alpha, \sin \alpha) /\|(\cos \alpha, \sin \alpha)\|
$$

$\alpha \in[0, \pi / 2]$. We can define a function $:[0,2] \rightarrow[0, \pi / 2]$ such that $e_{f(a)} \in M\left(T_{a}\right)$. By the Remark for each $a \in(0,2)$ we can find a unique $g(a) \in[0, \pi / 2]$ such that $\left\|T_{a} e_{g(a)}\right\|=$ $=\inf \left\{\left\|T_{a} x\right\|:\|x\|=1\right\} \quad$, and we put $g(0)=0$, $g(2)=\pi / 2$.
It is not hard to see that the functions $f$ and $g$ are continuous. Moreover $f(C)=\pi / 2$ and $f(2)=0$. By the Darboux property of the continuous function $f-\sigma$, on $[0,2]$ there exists $a_{0}$ such that $f\left(a_{0}\right)=g\left(a_{0}\right)$. Wie have
$\left.\left\|T e_{g\left(a_{0}\right)}\right\|=\inf \left\{\left\|T_{a_{0}} x\right\|:\|x\|=1\right\} \leqslant \sup \left\{\left\|T_{a_{0}} x\right\|:\|x\|=\right\}\right\}-\left\|\mathrm{Te}_{f\left(a_{0}\right)}\right\|$ Thus $T_{a_{0}} /\left\|T_{a_{0}}\right\|$ is an isometry. Hence $\|{ }^{T_{a_{0}}}\left((i, j)\|=\| T_{a_{0}}((0,1)) \|\right.$ and $a_{0} /\left\|T_{a_{0}}\right\|=\left(2-a_{0}\right) /\left\|T_{a_{0}}\right\|=1$, so $\left\|T_{a_{0}}\right\|=a_{0}=1$. Therpfore $\|(x, y)\|=\left\|T_{a_{0}}(x, y)\right\|=\|(y, x)\|$.

Proposition. Suppose $\left(R^{2},\|\cdot\|\right)$ has the property $W$. Then positive isometries are exactly the operators of the form

$$
\left[\begin{array}{ll}
1 & 0 \\
c & 1
\end{array}\right] \quad \text { or } \quad\left[\begin{array}{ll}
0 & 1 \\
1 & 0
\end{array}\right]
$$

Proof. In view of Theorem 2 the operators having the above form are isometries.

Now assume that $T=\left[\begin{array}{ll}a & b \\ c & d\end{array}\right]$, where $a, b, c, d \geqslant 0$. is an 2sometry. Then $\|T((1,-1))\|=\|(|a-b|,|c-d|)\| \leqslant\|(a+b, c+d)\|=\| T(1, q)) \|$ $=\|T((1,-1))\|$. Thus $|a-b|=a+b$ and $|c-d|=c+d$, so $a b=c d=0$, which completes the proof.

Theorem 3. Let $B$ beatwo-dimensional space with the property $W$ and suppose $B^{\text {K }}$ is strictly convex. Then $B^{B}$ has the property $W$.
Froof. Let. $T \in \mathcal{L}\left(B^{*}\right)$ and $\|T\|=1$. We need to show that if there
exist two linearly independent vectors, say $\mathrm{v}_{1}, \mathrm{v}_{2}$, in $M(T)$ then $T$ is an isometry. Since $B$ and $B^{B}$ are strictly convex, there exists a one-to-one corespondence $B^{\pi} 9 u^{\pi} \longrightarrow u \in B$ such

 $\mathrm{i}=1,2$; also $\left(\mathrm{Tv}_{1}^{)_{1}}\right)^{\mathrm{K}} \neq\left(\mathrm{Tv}_{2}^{\mathrm{K}}\right)^{\mathrm{B}}$. Since B has the property W and $\left(T V_{j}^{\pi}\right)^{x},\left(T V_{2}^{K_{1}}\right)^{\pi}$ are linearly independent, the operator $T^{F} \in\left\{\beta^{\text {T }}\right)$ is an isometry. Therefore, by Proposition, $T$ is also an isometry, which completes the proof.

Problems. Characterize the Banach laticeswith the property w In particular describe the normsilon $R^{2}$ such that ( $R^{2},\|\cdot\|$ ) has the property $W$.

Can the strict convexity of $B^{*}$ be omatted in the assumption of Theorem 3 ?
